

You

- **WESBOGY (for 20 years)**
- **Foothills Growth & Yield Association**
- **Mixedwood Mgmt Association**
- **Sustainable Forest Mgmt Network**
- **MGM & GYPSY Models**

Me

- **Not a growth and yield expert**
- **No influence over budgets or resources**
- **Academic**
- **From the east**

What can I offer?

- **Forest management perspective**
- **Some observations from our experience**
- **Probably nothing new**
- **Value in reminders on fundamentals**
- **8 points**

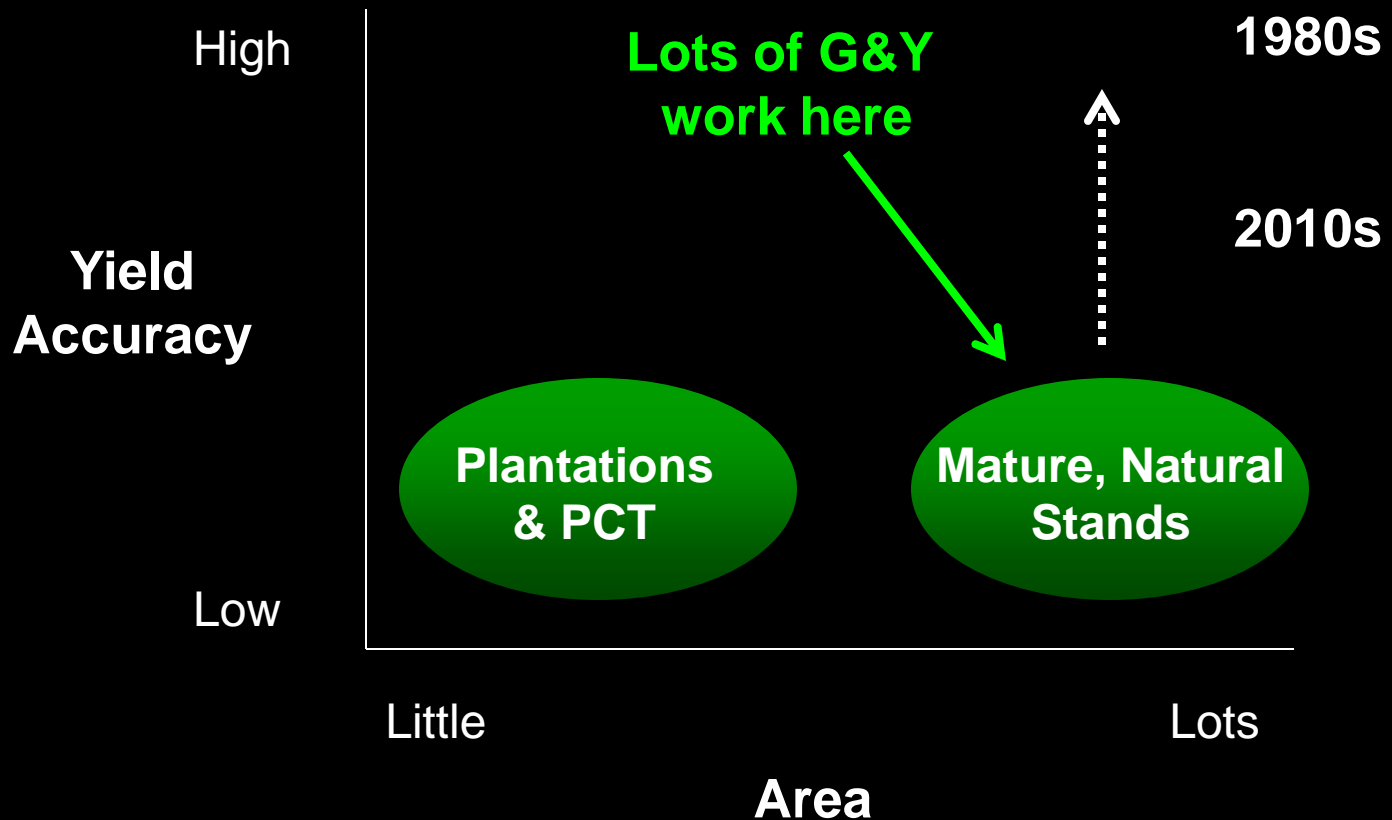

1 - Fry the Big Fish

- **Limited** resources for **unlimited** questions
- What G&Y issues of **most mgt importance**?

- Thorough forest-level modeling **in advance** can give much insight into G&Y **priorities**
- Including definition of **acceptable** error **tolerances**

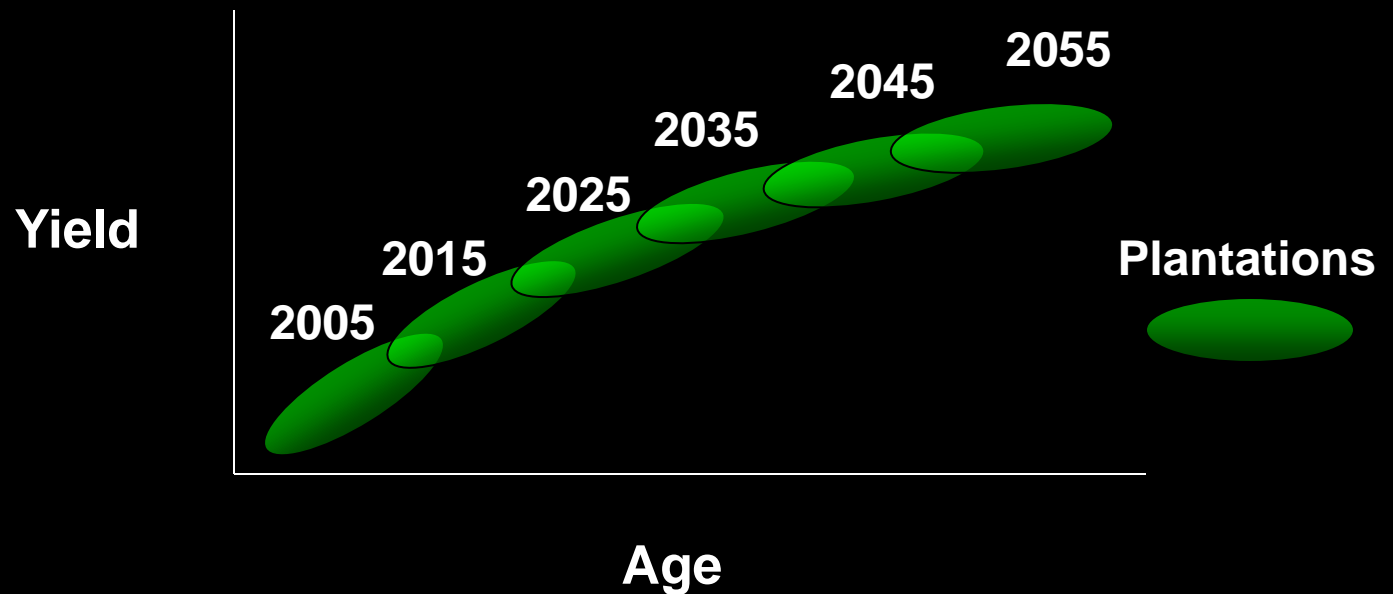

2 - Skate to where the puck will be

Act **now** in anticipation of what our
our **future requirements** will be

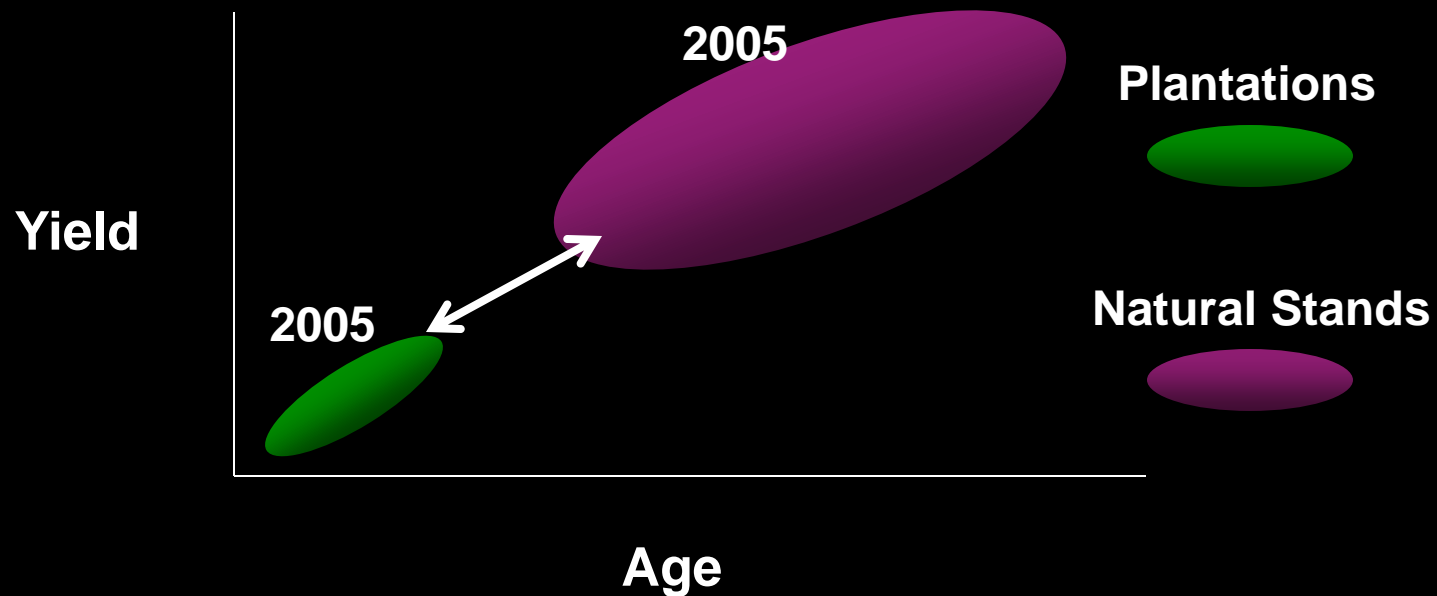

3 - Break the shackles of time

We will know the yield of a 50 year old plantation **50 years from now**

3 - Break the shackles of time

We will know the yield of a 50 year old plantation 50 years from now

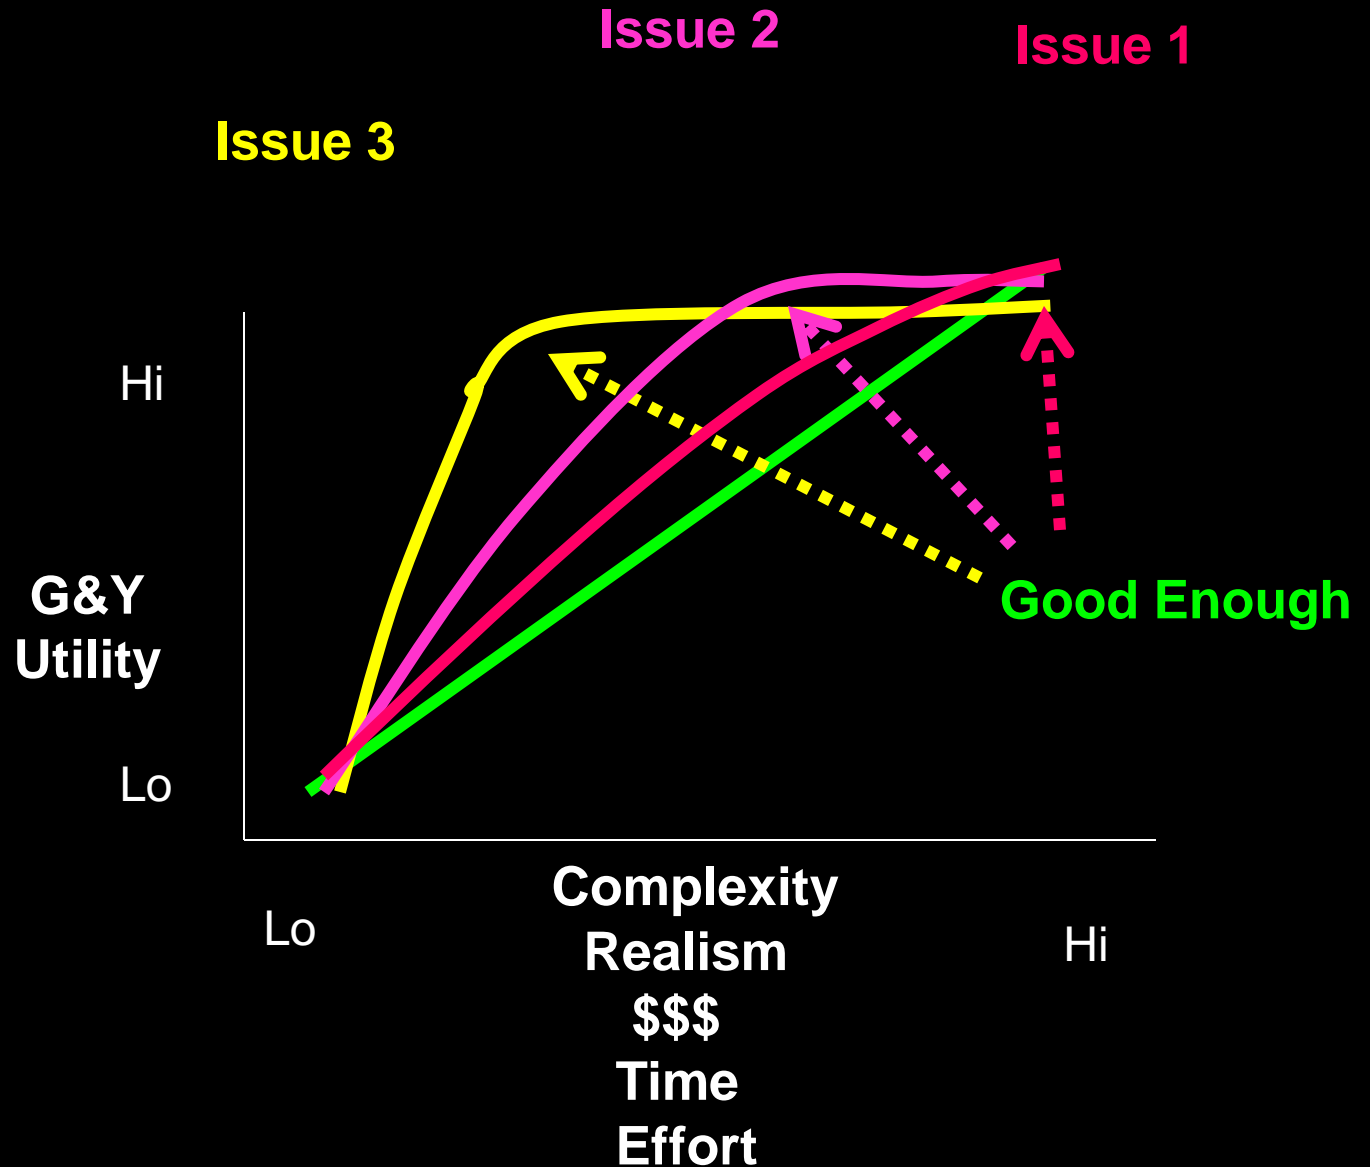

How can we use *natural stand* data *judiciously* to *replace waiting* for plantation data to become available?

4 - Put the canary in the mine

- Our growth & yield forecasts will be **wrong**
- How can we detect, diagnose & correct error at the **earliest opportunity**?
- Not just error in our models, but error in our application of them **to the forest at large**
- Error that exceeds an **acceptable tolerance**
- **Include explicitly** as part of G&Y strategy

5 - How good is "good enough"

6 - Beware of partial solutions

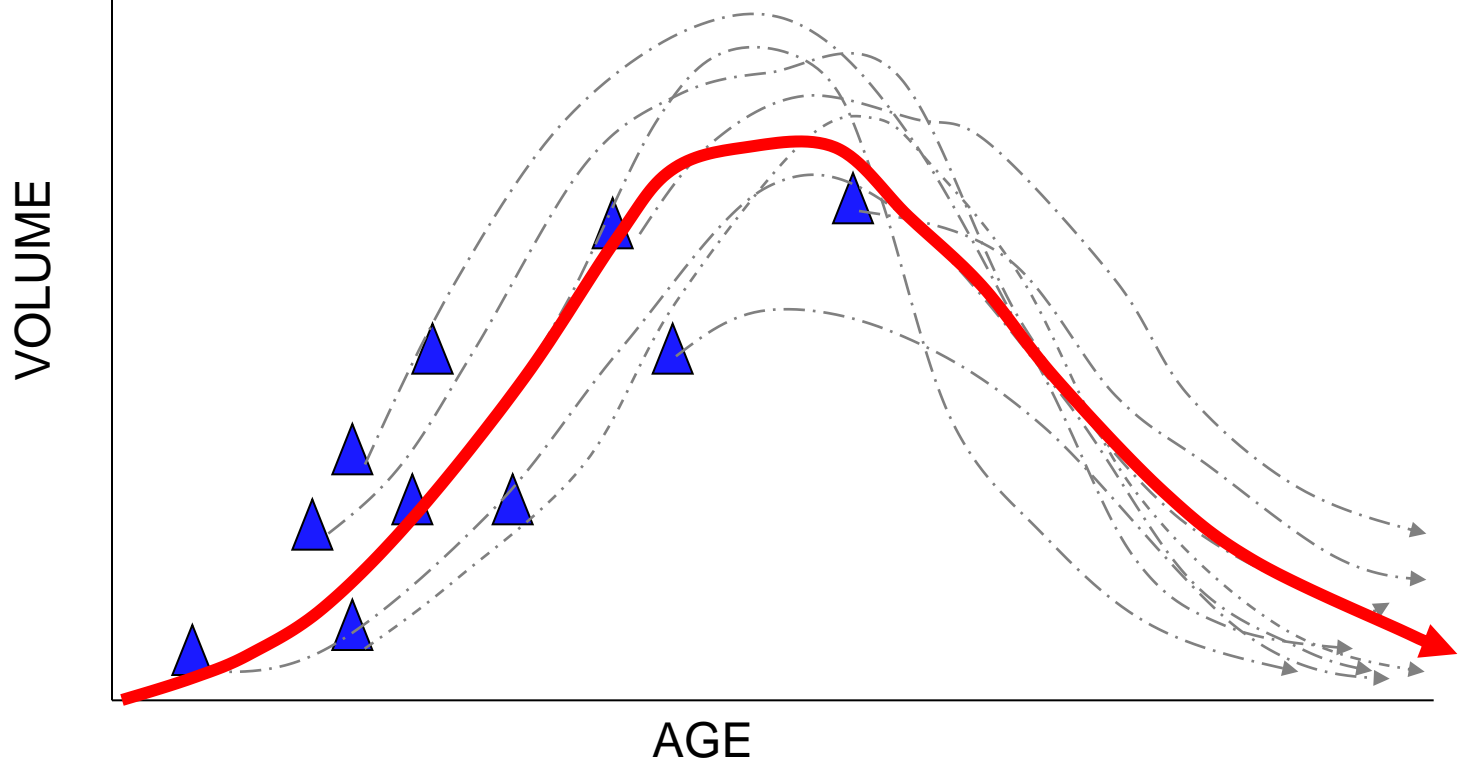

- What if we **cure** cancer & heart disease...
- But **not** Alzheimers
- What if we **naïl plantation yields**...
- But **not** their contribution to **diversity**?
- But **not** their impact on **nutrient status**?
- But **not** their value **habitat**?
- We need to **include these** other aspects in our growth and yield investigations

7 - Mind the Details of Application

- Growth & yield must be applied to the **forest at large**
- How can the inventory **initialize** growth and yield models?
- How can we **validate** against the forest at large?
- How should we **connect** the growth forecasts to forest stands?

7 - Mind the Details of Application

Stratum: BFSP
Area: 12,300 ha
Plots: 10

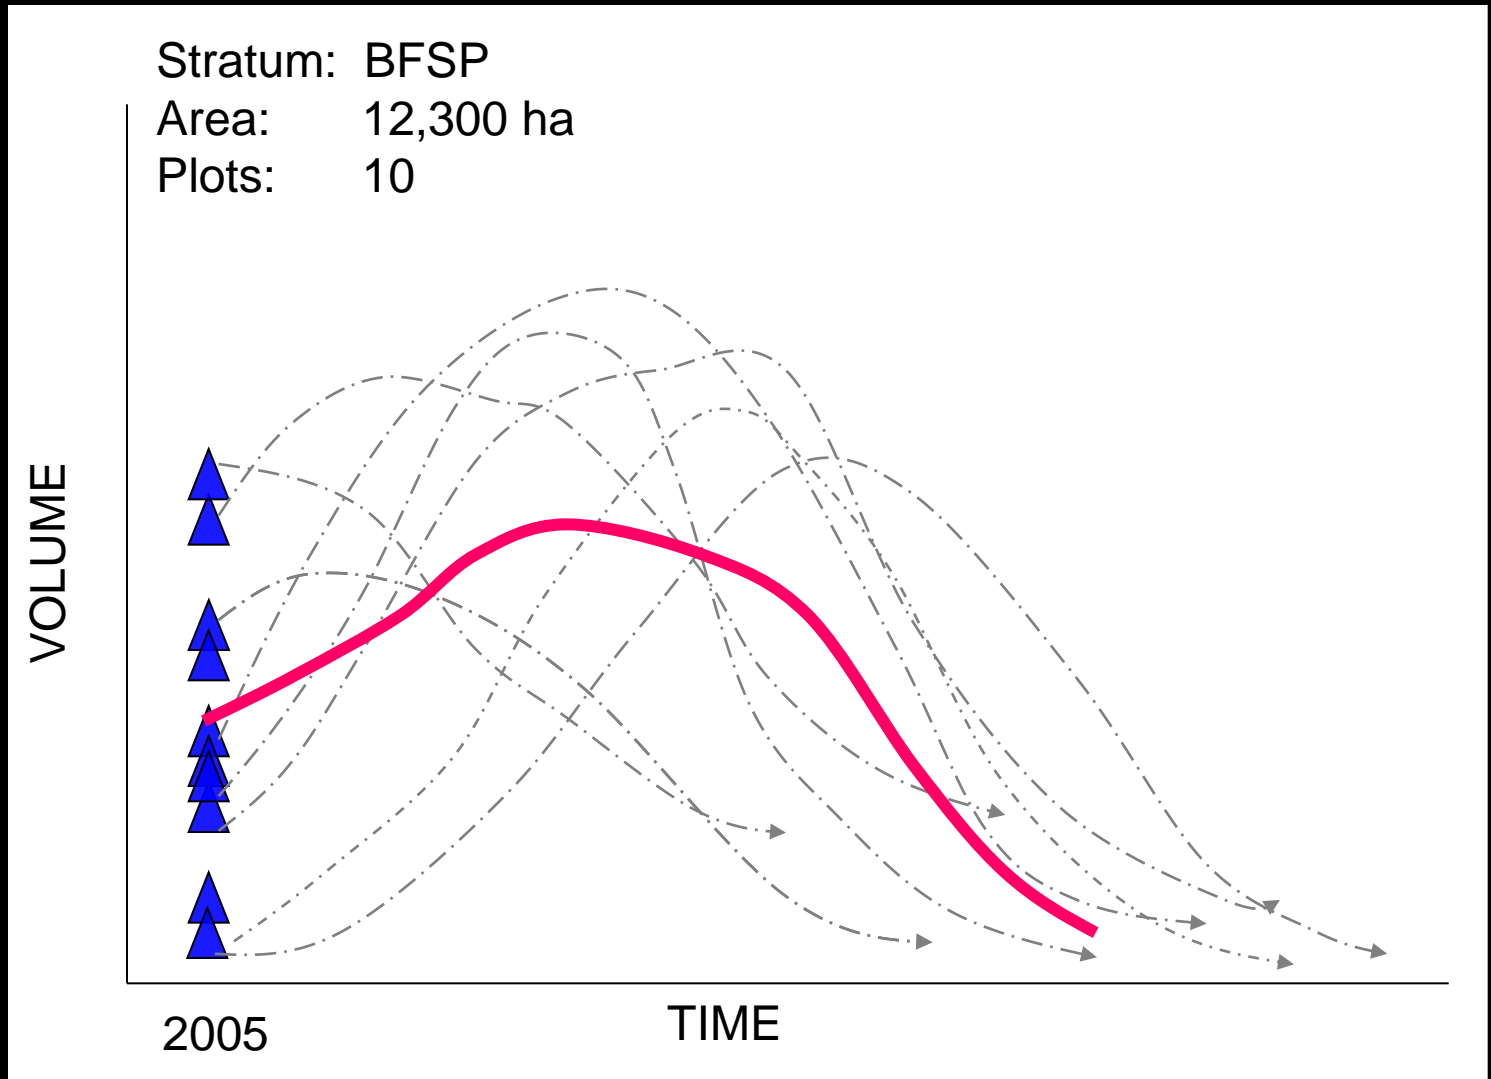

7 - Mind the Details of Application

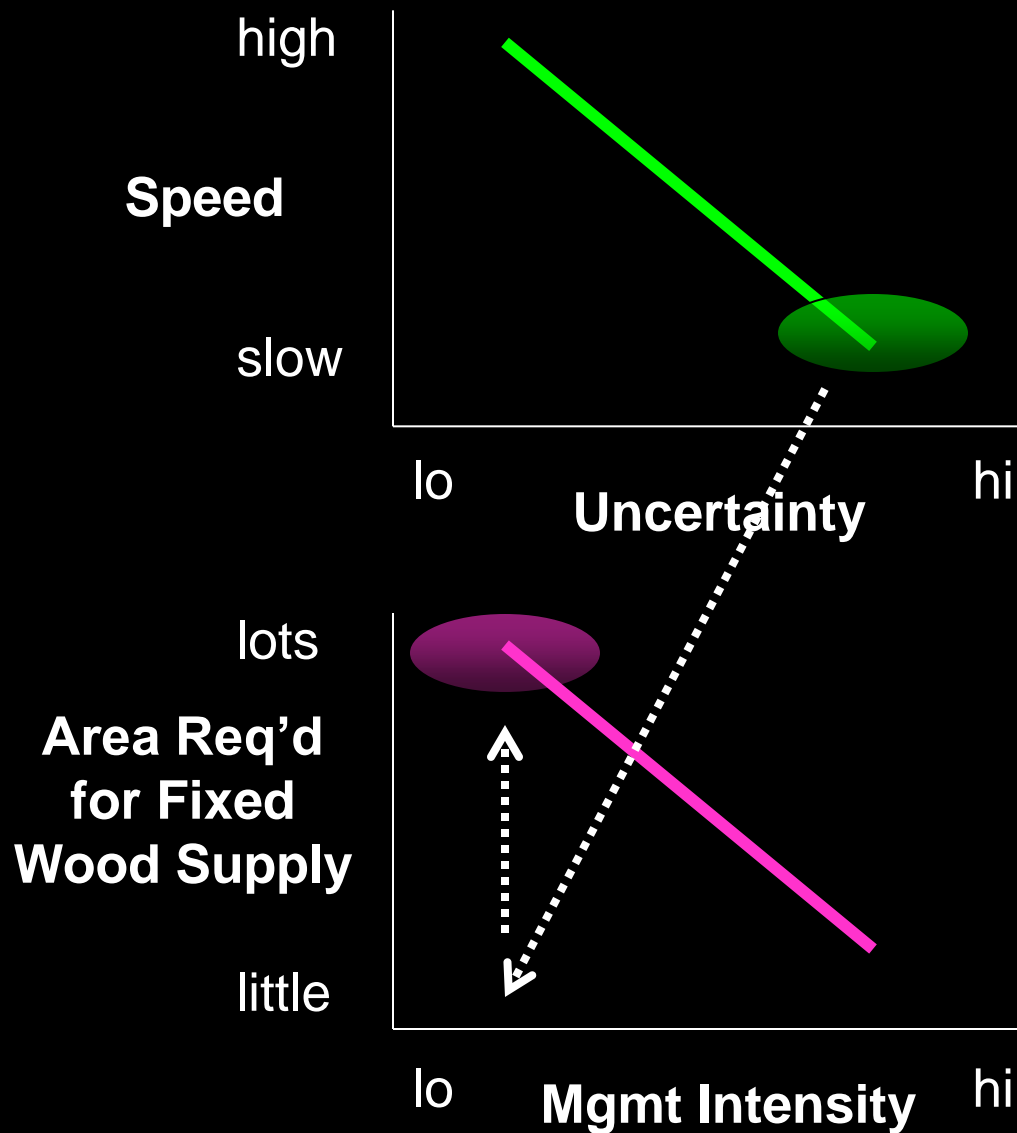

Stratum: BFSP
Area: 12,300 ha
Plots: 10

7 - Mind the Details of Application

8 - Uncertainty is a two-edged sword

Precautionary Principle

- Enlist allies from non-timber comm'ty to support G&Y

Summary

- Use thorough, thoughtful forest level analysis in advance to:
 - set priorities**
 - anticipate future requirements**
 - establish error tolerances**
- Find creative, defensible ways to apply ***existing data to non-existing conditions***
- Explicitly include ***diversity, habitat*** and other key elements in G&Y initiatives
- Enlist ***non-timber allies*** & supporters
- Address up front
 - early warning system**
 - validation (models & application)**
 - connection to forest-at-large**
