Setting Practical Indicators

Outline

- ⌘ Our reality
- ⌘ A context for achieving SFM
- ⌘ Monitoring
- ⌘ Characteristics of practical indicators
- ⌘ Examples
- ⌘ Challenges

Resource management

Our reality

- ∅ Increasingly complex
- ∅ Public scrutiny / involvement
- ∅ Better management - achieve SFM
- ∅ What is SFM, anyway?
- ∅ A sense that SFM will solve all social problems
- ∅ Provincial and national reporting
- ∅ Continual improvement (& demonstrate)

Other challenges. Opportunities?

Inventory Data

Opportunities

Planning Tools

Diverse Values

Scenario Forecasts
Expectations

Indicators - Selection & Monitoring

Regulations

Public participation

Changing legislation

Communications & Reporting

Management Strategies

model forest

A common commitment

“Making progress toward sustainability”

⌘ Definition of SFM required (CCFM)

⌘ Framework *(all the parts)*

⌘ Process *(how to do things)*

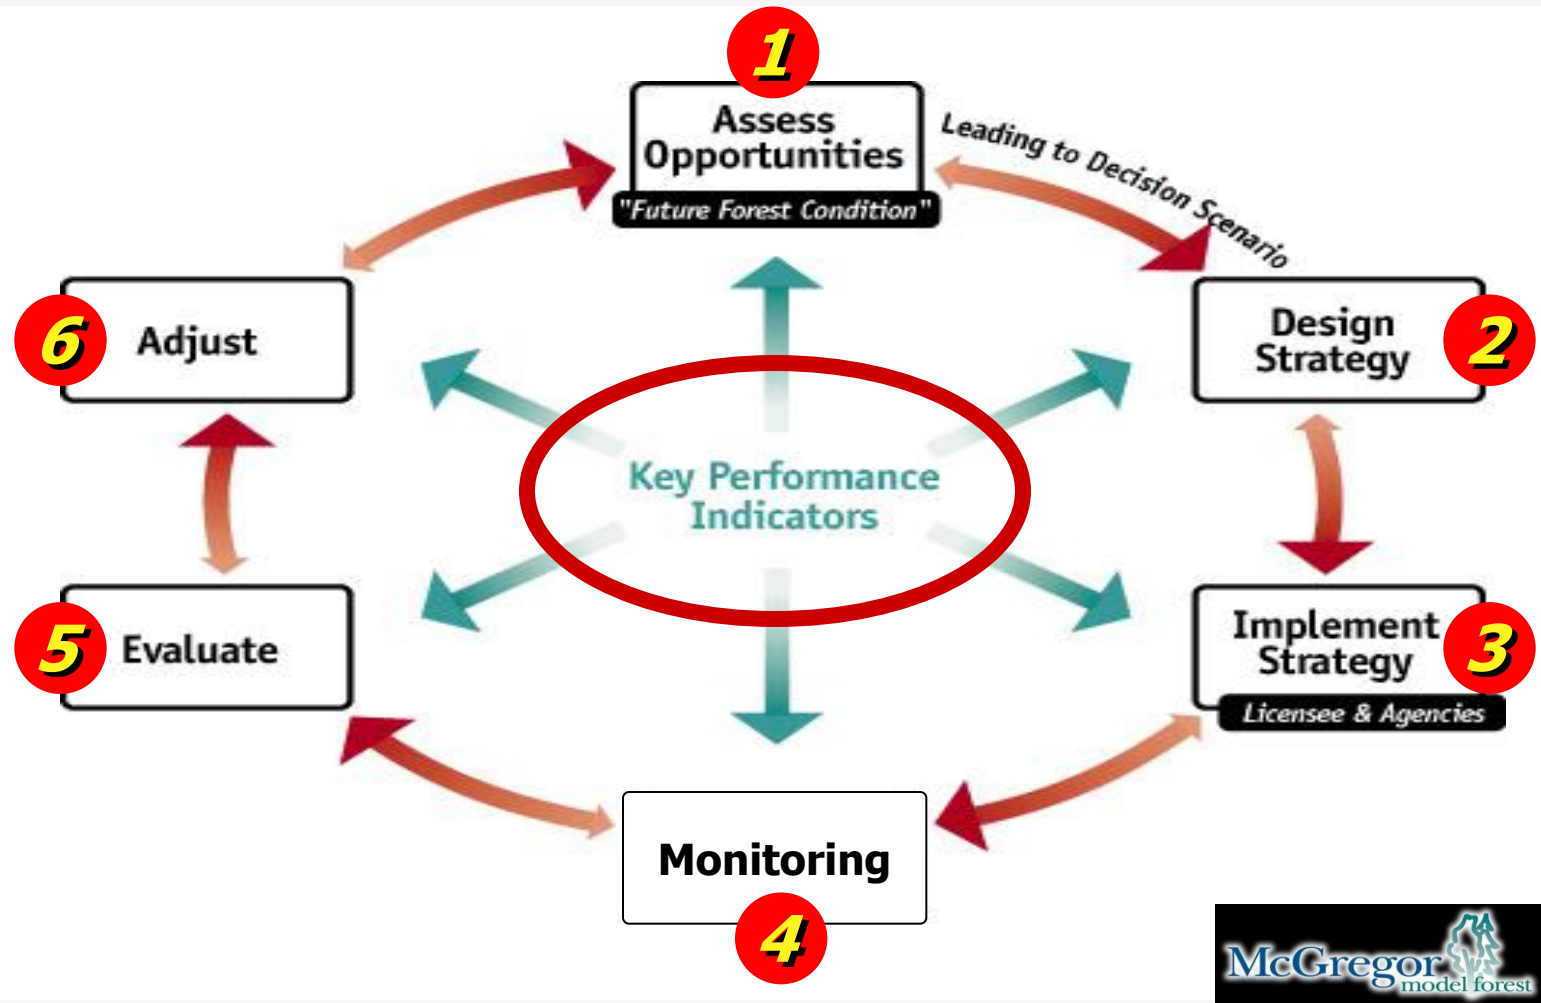

⌘ Evaluating progress

⌘ How, what, when, and why?

⌘ Now what?

An Orderly Approach - framework

Collecting data over time - monitoring

.....a process of collecting data over time for comparison to an explicit standard or a defined outcome at a specific time and space

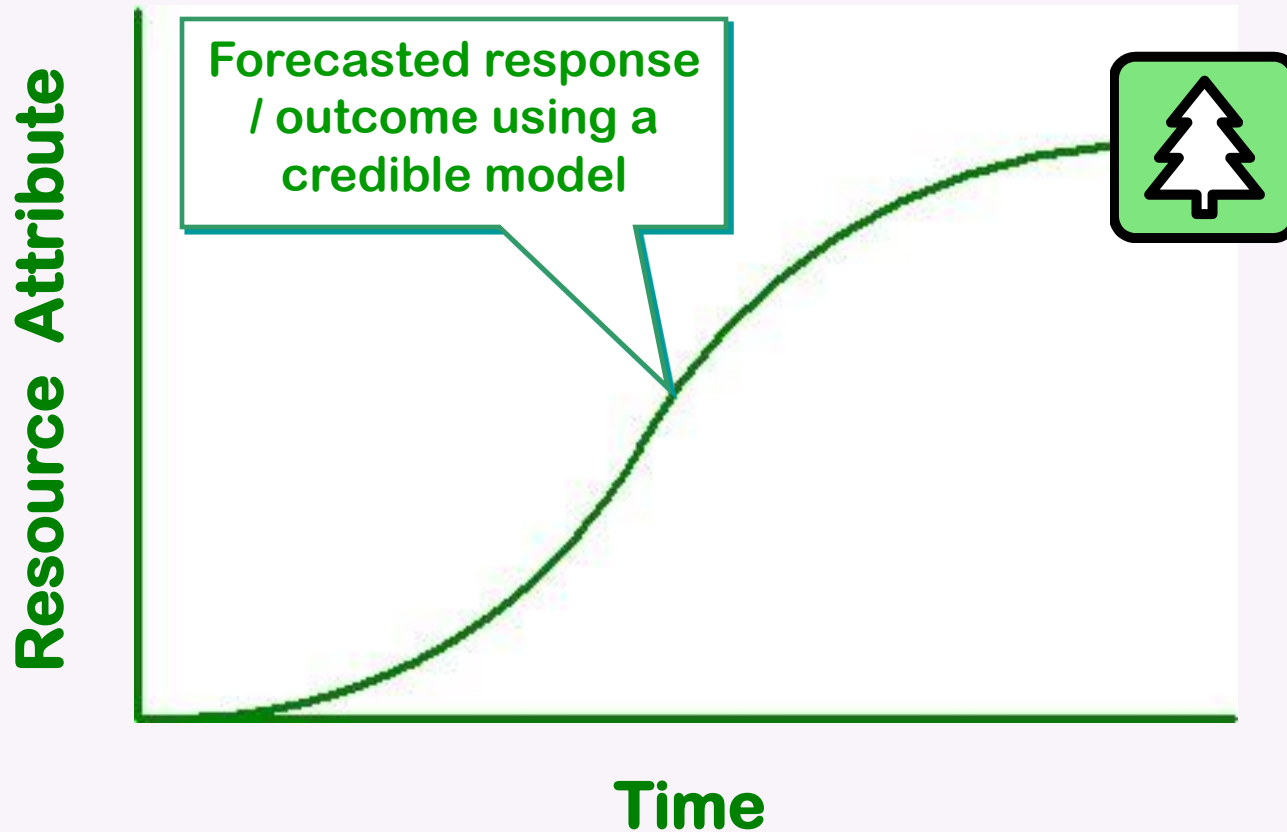

Three common types of monitoring

1. *Implementation*: is management direction accurately interpreted and followed?
2. *Effectiveness*: is progress being made toward the intended objective (s)?
3. *Validation*: are the assumptions used in developing management strategies valid?

Effectiveness monitoring

Forecast indicator over time

Effectiveness monitoring

Measure and ideally, OB values = Expected values

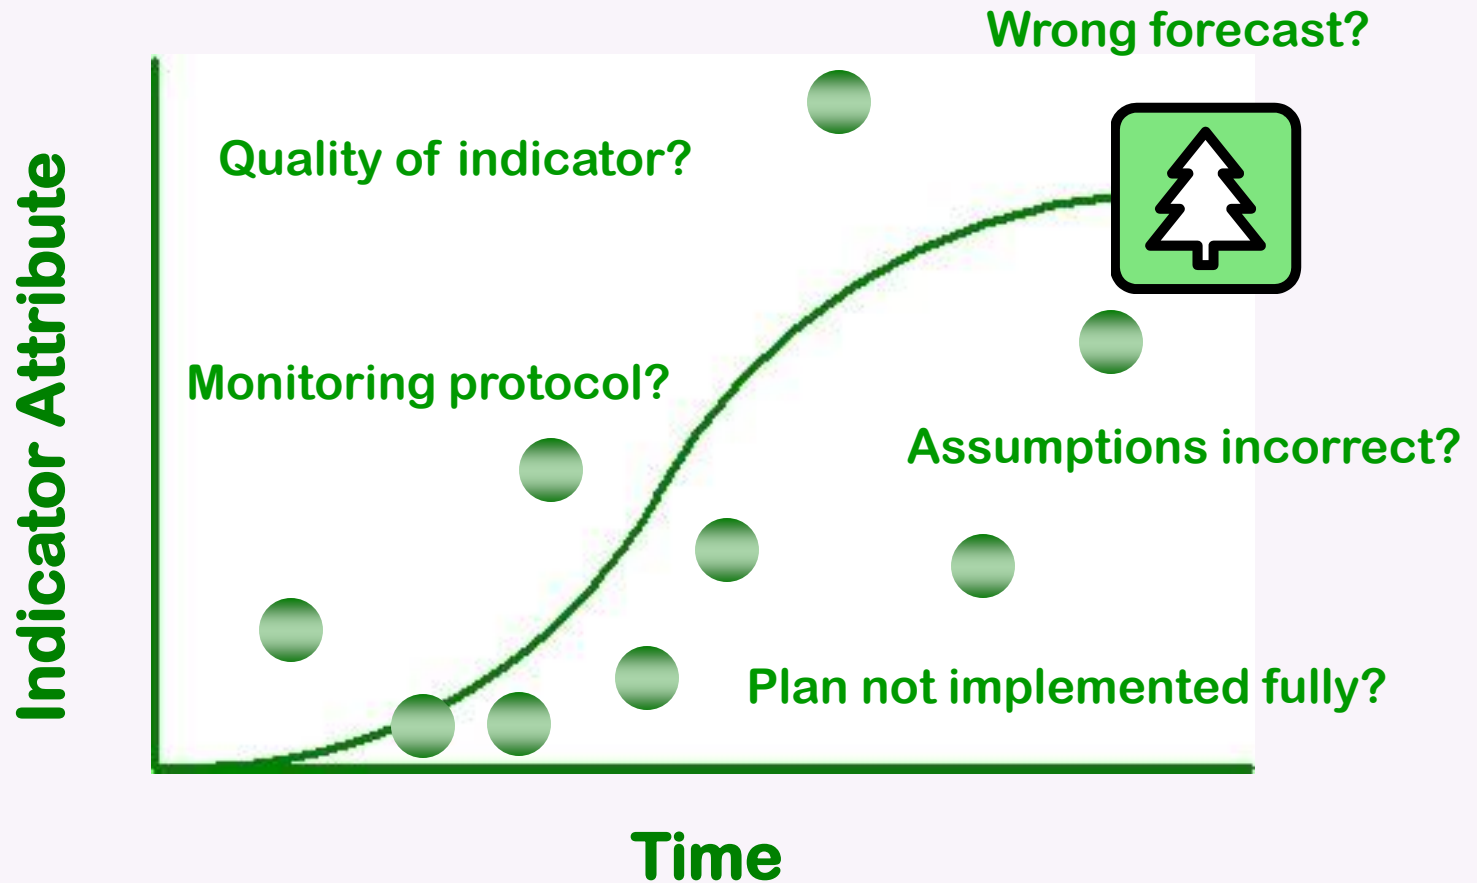

Effectiveness monitoring

But what does this mean?

Effectiveness monitoring

What's going on?

Setting practical indicators starts with well thought out objectives

Need to start with -

☞ **S • M • A • R • T** objectives

SMART objectives are:

S - *specific*

M - *measurable*

A - *achievable*

R - *realistic*

T - *time bound*

Landscape - Sustainability Objectives

Operational - Stand Level Objectives

Defining what we will measure

Re: Sustainability - Criterion

- ⌘ A category of conditions or processes by which sustainable forest management may be assessed (CCFM – 6 Criteria)

Indicator

- ⌘ A measure (measurement) of an aspect of the criterion that is influenced by action
- ⌘ *“Results count, so count results”*

Practical indicators are...

Representative

- ☞ Addresses criteria, shows trends over time

Reliable

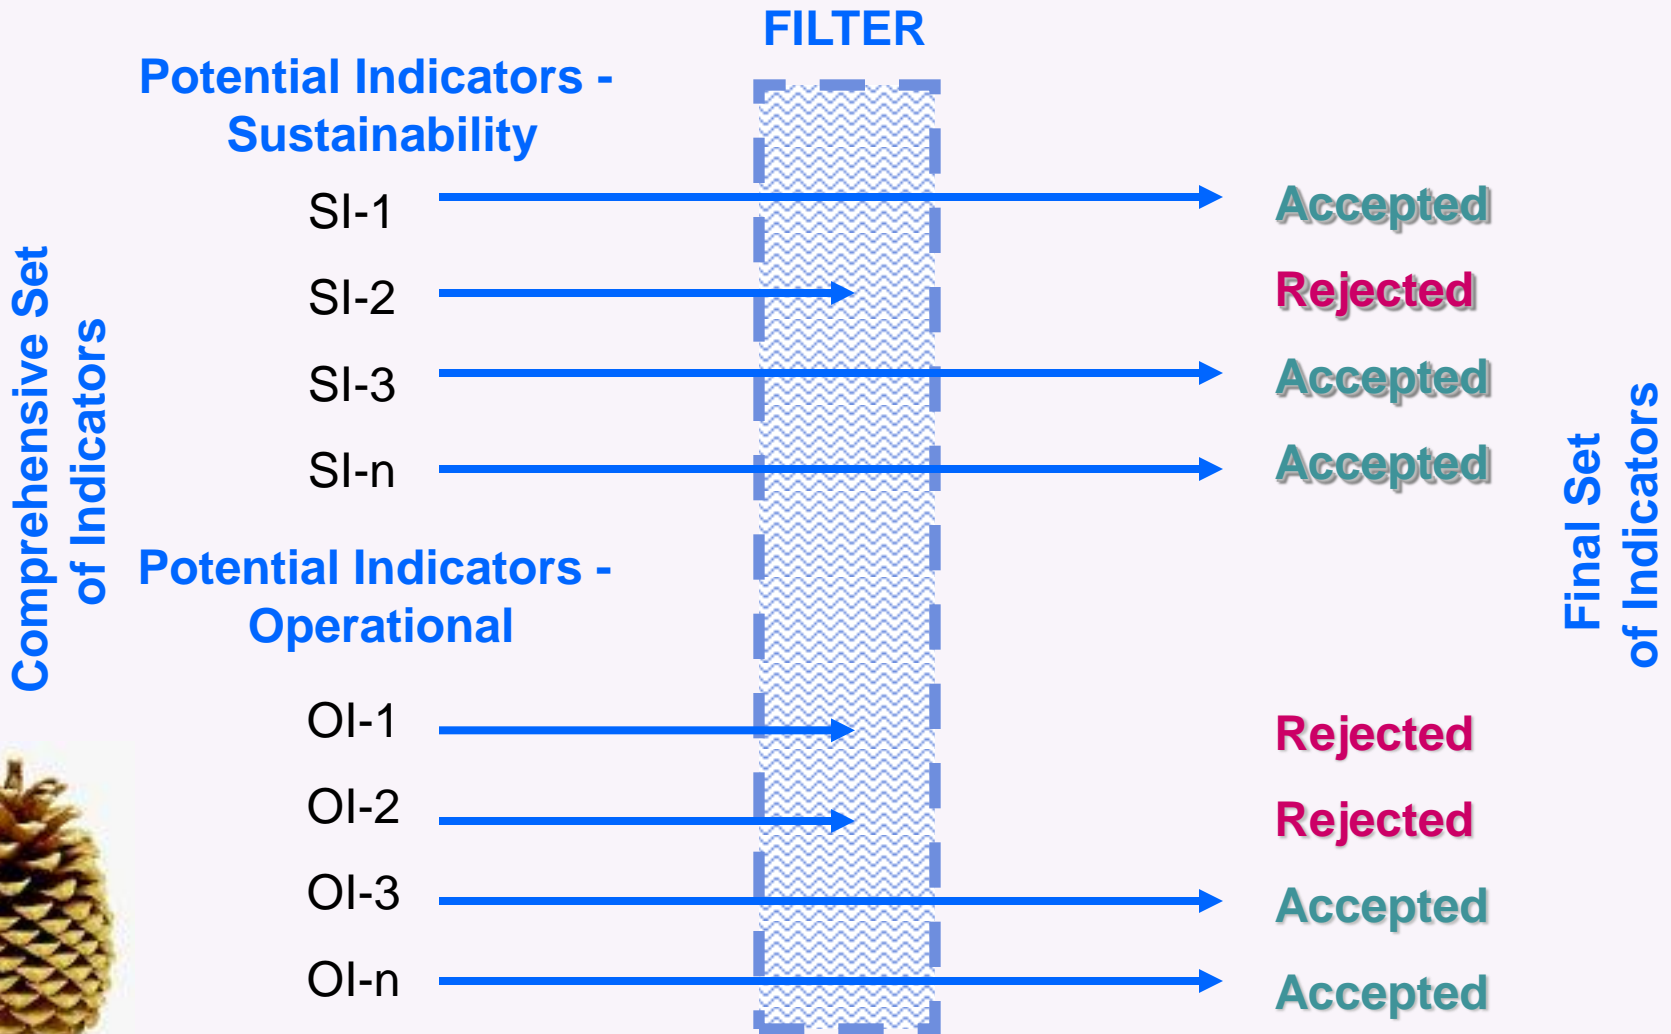

- ☞ Reflects achievement of objective, well founded and can be measured in a standardized way

Feasible

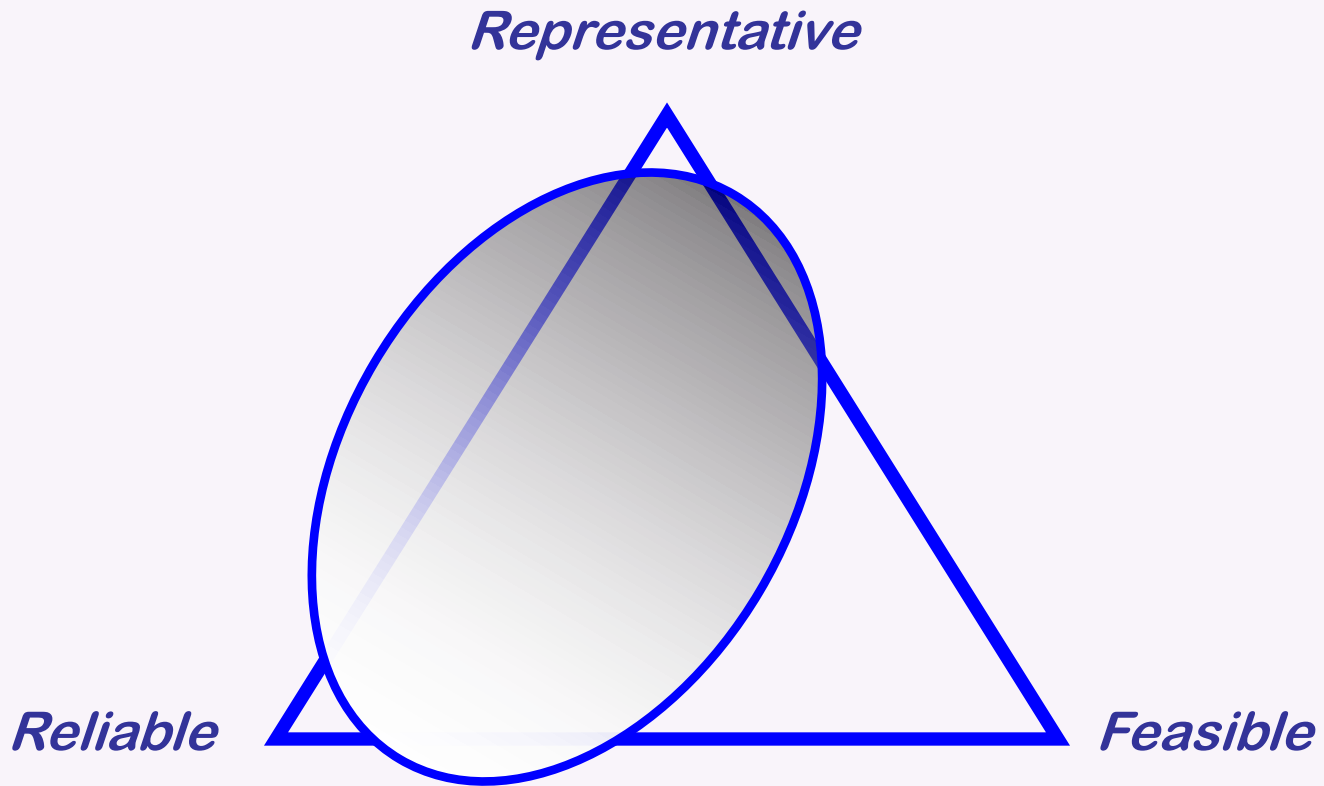

- ☞ Based on available or collectable data

Selecting a set of practical indicators

Selecting practical indicators – making choices

Selecting indicators -

Filtering based on

- ☞ Sensitivity - reflects change in resource value rather than reflecting factor that affect it (results count so count results)
- ☞ Availability of data - readily available, easily collected, measurable (vs. qualitative)?
- ☞ Relevance – is it measuring what is intended?

Selecting indicators -

Filtering based on

- ☞ Can be forecasted - expected outcomes relative to silviculture strategy
- ☞ Understandable
- ☞ Acceptable to the public
- ☞ Straight forward, void of confounding influences

Selecting indicators -

Filtering based on

- ☞ *Cost effective* - (expertise, equipment etc)
- ☞ *Easy to analyze* - and interpret
- ☞ *Supported* - science based,

Purposes of monitoring practical indicators

From landscape / operational perspectives are:

- ∅ to assess the status and determine emerging trends relative to management (*are stand level objectives being achieved and ecosystems being maintained?*)
- ∅ to identify what we still need to know about ecosystem dynamics that support the achievement of the objective
- ∅ to support management decisions
- ∅ to identify the need for specific support from science
- ∅ To support certification

Setting practical indicators

Experience – Chiloé

People – sharing, deciding

- ∅ Professionals
- ∅ Local communities

Values

- ∅ Sustainable communities

Goals

- ∅ Provide for family needs

Objectives

- ∅ Firewood supply

Measures of achievement - Indicators

- ∅ A management issue
- ∅ Education
- ∅ Indicator – Woodlot training
- ∅ Verifier – firewood supply

Setting practical indicators

Scenario Planning Project – Tesera Systems Inc

Robson Valley

- ⌘ Community Advisory Group
 - ⌘ Discussing, sharing, deciding
- ⌘ Values
- ⌘ Goals
- ⌘ Objectives
 - ⌘ Indicators
- ⌘ Assumptions → forecasting
- ⌘ Detailed output for decision making and planning

Developing indicators

What's in common?

- ⌘ Interested people seeking a solution for a common good
- ⌘ Based on values, goals, objectives
 - ⌘ Measure attributes related to forest capability and production, and
 - ⌘ What is understood by those involved
 - ⌘ Related to human condition – business / family
- ⌘ Interested in outcomes and change for the better

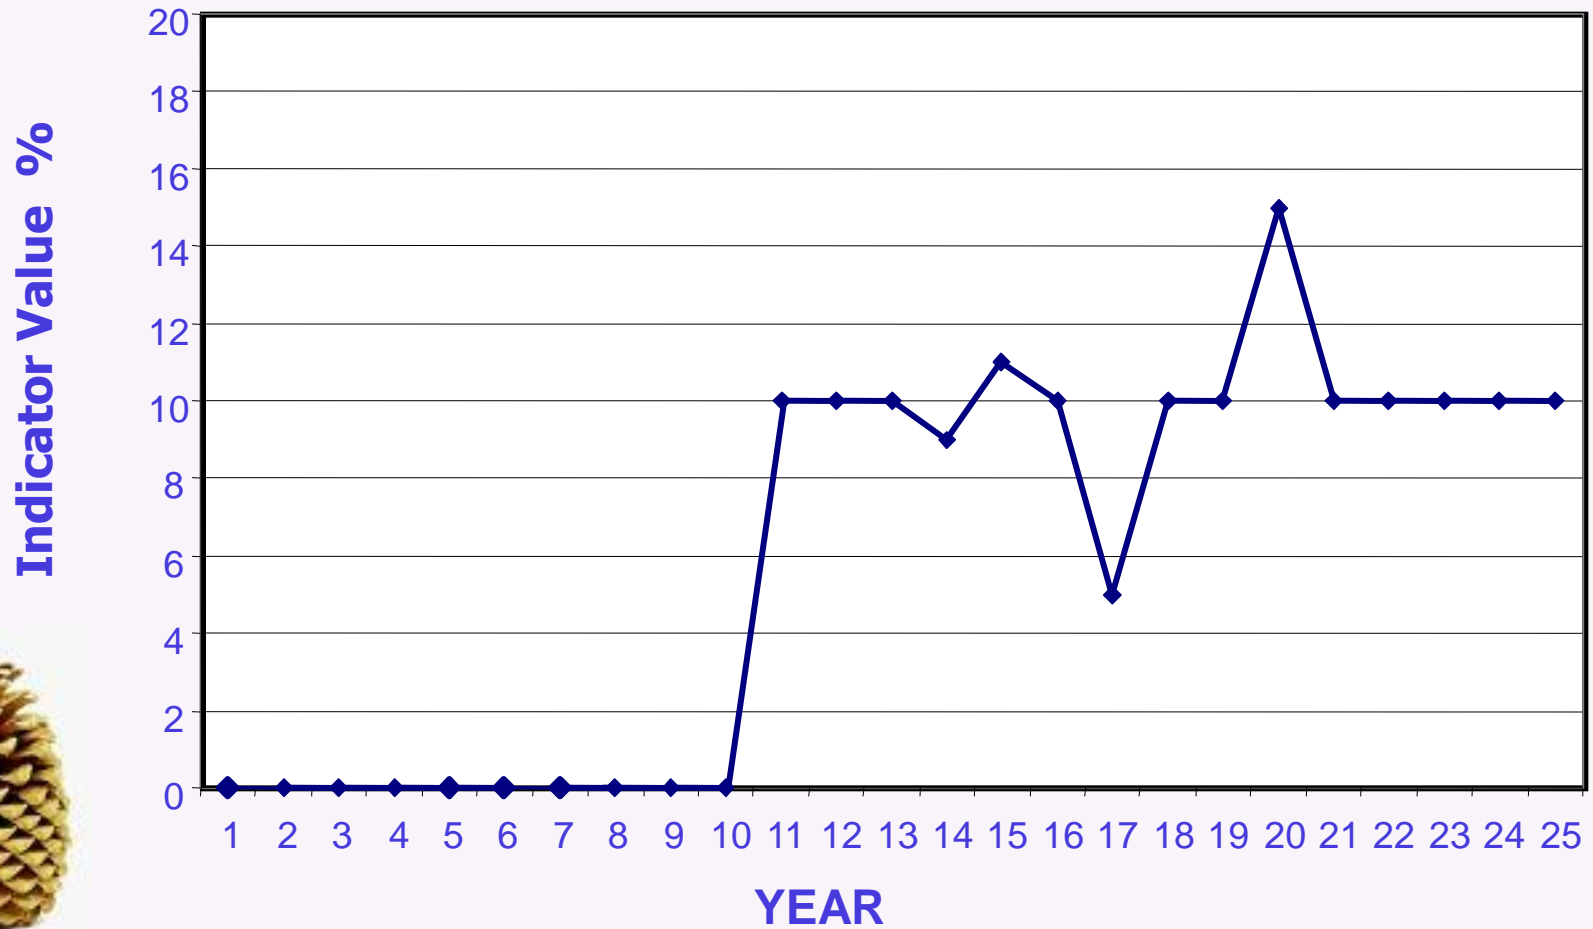

Forest renewal: an example of a simple indicator

Rate At Which Free Growing Status Is Declared

Forest renewal

Rate At Which Free Growing Status Is Declared

Forest renewal

Rate at Which Free Growing Status is Declared

Interpretation

Operational considerations

- ⌘ Effective silviculture program
 - ⌘ Inferences re: stock, site management

Landscape considerations

- ⌘ Sustainability
 - ⌘ Inferences on habitat, hydrology, forest health, aesthetics, social acceptability

**SCENARIO

Summary

- ☞ Assessing the system (human, ecological) allows for a determination to be made of sustainability
- ☞ Indicators reflect an aspect of the system (they must be representative, reliable & feasible)
- ☞ Setting practical indicators requires understanding of the relationship involved between management and system response
- ☞ Simplicity over complexity
- ☞ Question: Sustainable? For whom? For what? For how long? Over what area?
- ☞ We need to maintain a social consensus on the value of sustainability (defining it precisely, not advised)

Challenges

- ⌘ Selecting indicators that work together to provide understanding
- ⌘ Interpretation – one indicator tells one story, 40 indicators tell 40 stories
- ⌘ Simplify the process of selection
- ⌘ Indicators are tools, dare to change
- ⌘ Not falling into the trap of managing indicators, and forgetting the forest
