1. Background

In 1999, the Foothills Model Forest (FtMF)¹, responding to interest by industry and government, facilitated collaboration among 9 companies holding Forest Management Agreements on the Eastern Slopes to create the Foothills Growth and Yield Association (FGYA) for co-operative forecasting and monitoring of managed stand growth and yield in Lodgepole pine.

The FtMF appointed and provided funding towards a part-time Director in June 1999, with the mandate to develop a growth and yield co-operative. A memorandum of agreement was developed and endorsed by 9 companies, the Land and Forest Service (now Alberta Sustainable Resource Development), and the Foothills Model Forest effective April 1, 2000. Nine companies presently participate in the FGYA as voting members. The Alberta Department of Sustainable Resource Development (ASRD) and the Foothills Research Institute (FRI) participate as non-voting members, with FRI acting as the coordinating agency. The FGYA operates as a program under the Foothills Research Institute and its annual work plan is also submitted to the Board of the FRI for review and approval.

The Foothills Model Forest, acting as applicant on behalf of the 9 sponsoring members, submitted a proposal to the Forest Resource Improvement Association of Alberta (FRIAA) in July 2000. A contract was issued (FOOMOD-01-01 – *Foothills Growth and Yield Association*) on July 25, 2000, facilitating use of FRIP (Forest Resource Improvement Program) funds to cover membership costs and project activities. The original contract had an initial term of 2 years, and was amended in September 2001, extending the term to 5 years (April 1, 2000 to March 31, 2005). In 2005 a second 5-year term was approved (April 1, 2005 to March 31, 2010) under FRIAA Project # FOOMOD-01-03. In 2010, the FGYA will submit a proposal for a third 5-year project renewal, carrying the program through the 8-14 year performance survey window in the Alberta Regeneration Standards. This Business and Work Plan will form the basis for the new five year plan which will ensue.

During the 2001-02 fiscal year, the FGYA established a major project to forecast and monitor development of Lodgepole pine regenerated after harvesting, and assessed opportunities and requirements for other cooperative projects. At the FGYA's March 2002 Annual Steering Committee Meeting the Committee reviewed and accepted a business plan that rationalized the Association's mission, strategies, projects and financial requirements for the next 5 years. The plan identified a total of 6 projects, all of which have been implemented and are now in various stages of completion. In 2007, a new project dealing with mountain pine beetle impacts was added. The plan has been updated each year since 2004.

This version of the plan covers the period commencing April 1, 2010, with projections 2-5 years ahead depending on project plans and expected durations. Costs, revenues, activities and deliverables are scheduled by year. Work is scheduled in detail for the coming year (April 1, 2010 – March 31, 2011).

¹ Effective spring 2008, the Foothills Model Forest changed its name to the Foothills Research Institute, in keeping with its new 5-year business strategy and to better represent the nature of the organization's mission.

2. Mission

The interests of the parties constituting the FGYA are stated in the Memorandum of Agreement among members as follows:

- The companies that are signatories of the Agreement wish to participate in a cooperative program for the forecasting and validation of managed stand growth and yield, particularly of Lodgepole pine;
- The Alberta government wishes to promote the scientific development and validation of yield forecasts used by tenure holders in the development of forest management plans;
- The Foothills Research Institute (FRI) wishes to promote cooperation and shared responsibility in the improvement of sustainable forest management practices.

The mission and mandate of the FGYA are to continually improve the assessment of Lodgepole pine growth and yield in managed stands by:

- Forecasting and monitoring responses to silvicultural treatments;
- Facilitating the scientific development and validation of yield forecasts used by members in managing their tenures;
- Promoting knowledge, shared responsibility and cost-effective cooperation.

The following indicators will measure success in performing the mandate, and may be used as criteria for evaluating and prioritizing project proposals and other FGYA activities:

- 1. *Forecasts*: stand-level timber yield forecasts are defensible and accepted by the scientific and regulatory communities.
- 2. *Validation*: recognized scientific, regulatory and certification standards for validation and monitoring of sustainable forest management practices are met.
- 3. *Knowledge*: managers' knowledge, and their abilities to predict responses to management practices, are improved, facilitating management by objectives rather than by arbitrary prescription.
- 4. *Awareness*: stakeholders influencing forest management decisions understand the probable effects of management interventions on stand development.
- 5. *Cost effectiveness*: investments in growth and yield assessment are cost effective, and there is no unnecessary duplication of effort.
- 6. *Equitable participation*: participants remain committed to the program, and share costs equitably.
- 7. *Relevance*: work is user-driven, results-focused, and directly applicable to management and crop planning.

3. Strategies

3.1. Project Development

The goals of the FGYA are being achieved through a series of projects developed cooperatively by members, in consultation with government agencies and other experts in growth and yield. Projects of the FGYA are designed to forecast and validate yields for treatment regimes and site conditions of interest to all members, in order to provide a credible and reliable basis for supporting and defending timber supply analyses and assumptions. *Yield forecasts* are defined here as quantitative estimates of future stand timber yields, agreed by the scientific and regulatory community as the most probable

outcome of the treatment regime being applied to the range of stand and site conditions specified. *Validation* will involve the establishment or adoption of well-designed and replicated field trials, and their periodic re-measurement to compare actual results against forecasts.

Quantitatively, the benefit of a project to each member will vary, and will be determinable only by the individual member. It is expected that each member will bring to the table during project definition those questions, issues and priorities that relate to their particular interests, and will participate actively in design, approval, implementation, and evaluation of the project. By these means, the qualitative value of projects will be assured, and the benefits to be achieved through collective effort and pooled resources will far exceed the outcomes of individual efforts in similar endeavours.

The nature of tree growth requires the program to be long-term and ongoing. Continually improved forecasts will be made of the growth and yield parameters being tested, using the best models and data available when the project is initiated and each time it is re-measured. Recent amendments to Forest Management Agreements in Alberta emphasize the importance of growth and yield in support of detailed forest management planning.

Detailed methods will be specified in project plans and experimental designs. Measured variables will include (a) stand and site parameters prior to or at time of treatment, and silvicultural treatment parameters, and / or (b) stand and site parameters at benchmark stand development stages. These variables will include, or be stratified by, a common ecological site classification system. Forecast variables will include future stand conditions, and timber yields from intermediate (if applicable) and final harvests, at utilization standards agreed by the members.

Recognized scientific experts in growth and yield, silviculture, biometrics, tree nutrition, and forest ecology will review project plans and results, and / or participate in analyses. Meetings will be held at least once a year, to which experts will be invited to attend and participate. Formal peer review will be encouraged through the publication of project results. Use of field trials for demonstration and ancillary research purposes will be promoted.

3.2. Project Priorities

A review of voting members' opinions conducted in 2001 indicated that responses to planting, vegetation management and density regulation treatments in harvest-origin stands were the highest priorities for investigation, followed by density and nutrition management in fire-origin stands. All members agreed to proceed with investigations of spacing, tending and pre-commercial thinning in harvest-origin stands, but there were variable opinions on the importance of commercial thinning and fertilization. The primary focus has remained on forecasting the development of post-harvest managed stands, and has been emphasized and re-affirmed by current interests and urgency for the development of regeneration standards linked to growth and yield. Although post-harvest stand development is the first priority for growth and yield assessment, the Association recognizes that (a) much can be learned from experimentation and assessment in fire-origin stands that is relevant and necessary for yield forecasting and sound silvicultural decision-making in post-harvest stands, and (b) strategic management of existing fire-origin stands requires an ability to predict responses to potential interventions such as thinning and fertilization.

As a basis for determining what stand variables should be measured and forecast, the members were also asked to rate the importance (high, medium, low) of various forest management objectives, with the following results:

- 1. Timber volume (annual allowable cut) was rated high by all members;
- 2. Wood value (related to cost of production and / or price of product) was rated high by a majority of members;
- 3. Ecological (primarily biodiversity and habitat), protection, and risk management objectives were rated medium to high by a majority;
- 4. A majority rated social objectives (e.g. aesthetics) low.

Following strategic discussions in January 2007, further direction from the Steering Committee in February and the field tour in July 2007, a proposal entitled "Monitoring and Decision Support for Forest Management in a Mountain Pine Beetle Environment" was developed and accepted for FRIAA funding. This funding, and other funding committed by the FRI provides support for the new project described in Section 4.

As directed by the Steering Committee at their March 2008 meeting, the FGYA Technical Committee reviewed the priorities at its June 2008 meeting, and developed the following updated list of priorities (existing projects noted):

- 1. Responses to planting, vegetation management and density regulation treatments in harvest-origin stands.
 - Project 2 Regenerated Lodgepole Pine
- 2. Mortality, forest health and risk management in regenerated stands following harvest, including the effects of climate change. This includes the impact of Mountain Pine Beetle on forest health and post-beetle regeneration and stand management strategies
 - Project 7 Monitoring and decision support, MPB
 - Project 2 Evaluation of the impacts of climate variation on regeneration performance is being added to this project. (This will focus on immediate effects, but results and link to climate models could also be applied to prediction of long term climate change impacts.
 - No other project on climate change impacts and strategies at present
- 3. Investigations of spacing, tending, nutrition and thinning in harvest-origin stands including application of results from density and nutrition management trials in fire-origin stands.
 - Project 3 Post Harvest Stand Development conference and dialogues
 - Project 4 Historic Research Trials
 - Project 6 Enhanced Management of Lodgepole Pine
- 4. Impacts of density management on wood quality over time
 - No project at present, however the R&D Associate is collaborating with the Canadian Wood Fibre Centre in calibration of the Historic Research Trials data against a wood quality model currently being adapted from an earlier study by Weldwood of Canada Ltd. (now West Fraser Mills Ltd.)

The above priorities are reflected in the identification and development of the projects described in Section 4.

3.3. Roles, Responsibilities and Assigned Tasks

The FGYA is a cooperative initiative involving voting members (industrial sponsors), ASRD and the Foothills Research Institute (as Coordinating Agency). It does not exist as a separate organization under Alberta or federal law, but rather operates as a program of the Foothills Research Institute.

3.3.1. Voting Members

Voting members must be corporations or corporate divisions holding forest management tenures in Alberta. Responsibilities of the voting members will include:

- Installation and measurement of growth and yield trials (either directly or by financial and other support of work undertaken by contractors administered through the FRI) as specified in work and project plans approved by the Steering Committee;
- Provision of error-free data, in a format defined by the Coordinating Agency and the Technical Committee, from those measured under direct supervision of the member;
- Appointment of a representative to the Steering Committee with authority to vote and represent the Member's strategic and financial interests;
- Assignment of a representative to the Technical Committee with authority to represent the Member's technical views and interests;
- Payment of an annual membership fee approved by the Steering Committee to support the direct costs incurred by the Coordinating Agency in the management of the Association.

Field trials and associated silvicultural activities will be conducted under authority of the sponsors' timber tenures.

Overall control of management of the FGYA is vested in the Steering Committee, which will:

- Meet at least once each year;
- Elect from among the voting members' representatives a chairperson who calls and chairs meetings;
- Define, periodically review, and revise as necessary, a minimum project contribution level for voting members;
- Set, annually review, and revise as necessary, annual membership fees;
- Review and approve project plans, data standards, annual work plans, annual operating budgets, reports, and priorities for supporting research;
- Review and approve contracts for outside services, data sharing agreements, and other business arrangements proposed by the appointed Program Manager;
- Approve assignment to the FGYA of personnel hired or contracted by the Coordinating Agency;
- Approve the publication and dissemination of information resulting from FGYA projects.

Effective April 1, 2006, the term for the elected chairperson is 2 years i.e. the current Chairman's position will expire March 31, 2012.

The Technical Committee, supported by the Research and Development Associate, and Program Manager, will:

- Develop project plans, experimental designs and standards for approval by the Steering Committee;
- Assist the Program Manager in the development of work plans and budgets;
- Coordinate the installation and measurement of field trials;
- Monitor project implementation, quality control, and data delivery, and evaluate results.

3.3.2. Alberta Sustainable Resource Development

The Forestry Division (FD) of ASRD has undertaken to:

- Assign the Executive Director of the Forest Management Branch, or other authorized senior official, to participate on the Steering Committee in a non-voting advisory capacity;
- Assign a technical expert, or experts, knowledgeable in forest planning and yield forecasting, to the Technical Committee to provide advice on matters pertaining to project planning, experimental design, quality control, data acquisition, model development and validation, project evaluation, and regulatory requirements for yield forecasting and validation.

3.3.3. Foothills Research Institute (FRI)

The Foothills Research Institute, as Coordinating Agency for the FGYA, will be responsible for:

- Administration of the Association as a Program of the Foothills Research Institute;
- Appointment of a representative of the Foothills Research Institute Board of Directors to the Steering Committee in a non-voting capacity;
- Dissemination of information to, and continuing education of, FGYA members in matters relevant to the Association;
- Preparation and submission of the reports.

The Foothills Research Institute will also:

- Retain the services of a Program Manager to manage the Association and to coordinate and ensure quality control of field services undertaken by contractors;
- Retain or assign other required staff and contract services;
- Administer the annual operating budget of that portion of the Association's program for which it is directly responsible;
- Control expenditures in accordance with the approved operating budget, generally accepted Canadian accounting practices, and FRIAA requirements;
- Maintain books of account of all funds contributed and dispersed on behalf of the Association, in accordance with generally accepted Canadian accounting practices, and subject to annual independent audit;
- Procure and maintain equipment and supplies required by the Association;
- If applicable, procure, own, and maintain equipment requiring capital expenditures, and lease such equipment to the Association at rates not exceeding fair market value;
- Maintain a secure repository of all FGYA data.

3.3.4. Program Manager (Director of Operations and Field Coordinator)

The Program Manager will be a firm or one or more individuals retained to undertake the following duties:

- Preparation of annual work plans and budgets, and annual updating of a 5-year business plan;
- Chairing of a Technical Committee consisting of representatives from 11 member organizations, and consultation with the members regarding the development and management of projects;
- Ensuring that project proposals, plans, experimental designs, and data standards are developed in a timely manner;
- Control of data quality consistent with plans and standards approved by the Steering Committee;
- Oversee loading (including quality control), compilation and maintenance of FGYA project databases;

- Ensuring that projects are implemented in a timely manner consistent with approved program and project plans and quality standards;
- Planning, supervision and quality control of field research and measurements, including the overseeing and auditing of contracts and the coordination of inputs by technical representatives;
- Dissemination to FGYA members of relevant information, including a minimum of one educational meeting or field trip per year;
- Preparation of progress reports every six months or as otherwise requested by the Steering Committee, and of annual program and project reports;
- Collaboration and cooperation with other agencies as appropriate and necessary to further the interests of the Association.

The Program Manager will:

- Enter into a one-year renewable employment agreement or services contract with the Foothills Research Institute to undertake the above duties;
- Retain or sub-contract any additional personnel required to fulfill the list of duties specified above;
- Report to the FGYA Steering Committee and the General Manager of the Foothills Research Institute;
- Work closely with the FGYA Research and Development Associate;
- Be provided data management and financial accounting support by the Foothills Research Institute.

The required level of input is expected to be approximately 75 man-days per year, and to be split between professional program direction and technical field coordination by one or more registered forestry professional(s). Funding, implementation and extent of the services are subject to initial and annual approval by the Steering Committee.

3.3.5. Research and Development Associate (Technical Director)

A Research and Development Associate will be retained on a part-time basis under a rolling 2-year contract by the Foothills Research Institute to provide analytical and technical direction services to the members and the Program Manager. He / she will be a registered professional forester holding an advanced forestry degree with extensive research and operational experience in growth and yield, and will undertake the following duties:

- Selection and development of analytical and modeling techniques for predicting the establishment, performance, growth and yield of Lodgepole pine in managed stands;
- Selection or development (as appropriate), testing, and validation of stand-level growth and yield models which best represent the experimental sites, practices and data evaluated;
- Analysis of data from FGYA field trials;
- Reporting of technical results of projects to FGYA members;
- Evaluating and, if appropriate, recommending continued support for research projects and trials a minimum of two years prior to any planned termination of support or maintenance;
- Development and testing of decision-support tools for application by Association members;
- Preparation of technical reports and papers for dissemination or publication;
- Liaison and communication with Association timber supply planners and silvicultural practitioners, and with researchers in collaborating agencies, as required for effective exchange of knowledge and ideas.

The required level of input is expected to be approximately 80 days per year. The Associate will report to the Program Manager on program responsibilities and administration and directly to the Steering and Technical Committees on technical results and products.

3.3.6. Field Services Contractors

A roster of suitably qualified field contractors will be maintained to assist the Program Manager in project implementation and quality assurance. These services are required for the installation and measurement of research trials. Planned project implementation will require the services of qualified contractors with proven experience in forestry field measurements, sample plot layout, and / or experimental silviculture.

Only contractors recommended or endorsed by FGYA member companies will be listed and engaged. Selection for projects will be competitively bid, or may be sole-sourced in situations where only one contractor is available with the required skills and experience. In the latter case, financial proposals will be evaluated by at least 2 technical representatives in addition to the Program Manager.

Member companies of the FGYA will undertake – using their own crews or field contractors of their choice - the remeasurement of the Regenerated Lodgepole pine plots, and submit the data to the Association for analysis.

If the Field Coordinator is a member of a consulting firm providing technical services to the FGYA either directly or through a member company, he must separate himself from direct involvement in field service provision whether through direct measurements or supervision of field crews doing the work.

3.4. Allocation of Effort and Costs

Each voting member will be charged an equal annual membership fee. The total amount levied will be sufficient to cover costs incurred by the Coordinating Agency in carrying out its responsibilities as defined in Section 3.3.3 above. Requirements are discussed in Section 5.1 and projected in Table 7, but will be subject to Steering Committee review and approval each year.

Unless otherwise provided for under special agreements with external sponsors and cooperators, the costs or direct effort for installing, maintaining, treating and measuring field trials will be shared among voting members. Costs and effort will be allocated according to the net operable pine-leading land area in the members' tenures. Where the member shares annual allowable cut (AAC) for a management unit, the contributing land base for that unit will be calculated as the total AAC land base multiplied by the member's portion of the AAC. Table 1 shows areas and percentage allocations as calculated in 2002. The allocation will be updated when significant changes occur to any member's net area. The reallocation will take effect in the fiscal year following the change being reported, and will not be applied retroactively.

Situations have arisen where members have already collected growth data from permanent sample plots (PSPs), potentially contributing to an FGYA project with considerable timesaving. Such contributions may be recognized and encouraged by crediting and offsetting the value of the data against the contribution that the member would otherwise make to the project under the allocation formula. The Technical Committee will assess the value of such contributions relative to the cost of new data collection, and make recommendations to the Steering Committee regarding what value should be credited to the member contributing data. The Steering Committee will make the final determination of the value to be credited. The FGYA will not normally reimburse the member directly, or allow credits to be accumulated from one project to another, so the maximum value that can be recognized is the project cost that would otherwise be allocated to the member for collecting new data. In the event that

such an offset is made, the cost of new data collection will be shared among the other members, in proportion to their net areas.

Member	Net area	%
	(ha)	of total
Alberta Newsprint Company	106,870	5.2
Blue Ridge Lumber	180,323	8.8
Canadian Forest Products	106,271	5.2
Millar Western Forest Products	112,406	5.5
Spray Lake Sawmills	114,988	5.6
Sundance Forest Products	121,848	6.0
Sundre Forest Products	293,655	14.4
Hinton Wood Products	451,713	22.1
Weyerhaeuser Canada	557,433	27.3
Total	2,045,507	100.0

Table 1. Work and Cost Allocation Based on Pine-leading Area

3.5. Collaboration with External Institutions

Cooperation with external agencies (i.e. non-FGYA members) is desirable and necessary for meeting the mandate and mission of the FGYA. However, a clear collaboration strategy is necessary to ensure that such cooperation is beneficial to the Association and its members, equitable, and an efficient expenditure of the Association's time and resources.

The FGYA may collaborate with other agencies in order to:

- Obtain expert advice on the design, analysis and interpretation of projects;
- Obtain assistance in the analysis of data and publication of results;
- Encourage independently funded supplementary research supporting and building on FGYA projects;
- Access relevant information sources, including through sharing and exchange of data where clearly in the FGYA's interest and approved by the Steering Committee;
- Improve communication between researchers and practitioners where such communication will benefit members and enhance the assessment of Lodgepole pine growth and yield in managed stands.

Where collaboration involves data sharing, significant costs, publication of FGYA information, and / or formal commitment to deliverables, the Program Manager will obtain the approval of the Steering Committee before proceeding. If deemed necessary and appropriate by the Steering Committee, the FGYA will enter into a formal memorandum of cooperation and / or collaborative research signed by the FGYA's chairperson. Such an agreement between the FGYA and cooperator will specify:

- Purpose and scope of the cooperation;
- Administrative roles and responsibilities;
- Contributions (financial and / or in-kind);
- Data ownership and access;
- Appropriate provisions and clarifications regarding liability, indemnification, amendment, notice, and dispute settlement;

- Term of agreement and time schedule for work commencement and completion;
- Schedule of committed deliverables.

No provisions in any such agreement may conflict with, encumber or supersede provisions contained in the Memorandum of Agreement between FGYA members or this Business Plan.

Collaborative arrangements in existence or planned include:

- Canadian Forest Service: The FGYA, the Northern Forestry Centre of the CFS, and the Land and Forest Division (LFD) of Alberta Sustainable Resource Development entered into an agreement in July 2002 for the cooperative management of historic Lodgepole pine research trials. This agreement was renewed in 2008 through to March 31, 2013, with the purpose remaining to be working arrangements for collaboration and continuing access to and use of historic trials for the purpose of improving knowledge of growth, yield, silviculture and fibre qualities. In 2009, the Canadian Wood Fibre Centre of the CFS committed \$50,000 to the FGYA Historic Research Trials project, to support the work of the FGYA and undertake additional measures and analysis of historic CFS plots.
- University of Alberta: On April 1, 2005 the University and FGYA entered into a collaborative agreement to participate in implementation of the *Enhanced Management of Lodgepole Pine* Project, this Agreement was updated in 2008, and extended until March 31, 2010 with the addition of a new project linked to the FGYA's Mountain Pine Beetle project #7.
- British Columbia: Informal dialogue with the B.C. Ministry of Forests Research Branch has proven extremely helpful without requiring specific or formal commitments on the part of the FGYA. The Research Branch of BCMOF has been supportive of the FGYA effort through providing access to the Tree and Stand Simulator (TASS) model for growth and yield analysis. This dialogue was continued and extended to regional Ministry staff such as those knowledgeable and involved in the management of regeneration following mountain pine beetle infestations, who were instrumental in organizing the July 2007 MPB tour.
- Loblolly Pine Growth and Yield Research Cooperative: The FGYA visited the Virginia-based Cooperative in 2006 to learn about its research, operation and structure. Members concluded that maintaining and building on the link established was desirable. The application of loblolly pine models and thinning practices to Lodgepole pine, based on "scaling" and "similarity analysis" approaches discussed and demonstrated during the tour, was of particular interest. The FGYA will consult with the Cooperative to investigate the application of these approaches.
- Other growth and yield associations: In 2006 the FGYA provided information on our objectives and structure, and participated in formal consultations with representatives from the Mixedwood Management Association and other Alberta agencies with a view to improved liaison and cooperation. We are particularly desirous to encourage and assist (a) efforts in other trees species similar to those we have made in forecasting juvenile stand performance in lodgepole pine and (b) information sharing on silvicultural risk management.

3.6. Data Sharing

New data collected and / or funded by a member specifically as part of an approved cooperative project will be provided to the FGYA and made available to all Association members. The Association's use of the data will be limited to that specified in project and work plans approved by the Steering Committee (unless otherwise directed by the Steering Committee). Digital files and data bases funded through FRIAA may be subject to access through provincial freedom of information legislation. Otherwise data will not be distributed outside the FGYA without the agreement of the contributing member or members. Section 8 of the Memorandum of Agreement among members imposes restrictions on the use of cooperative project data by individual members, including that no member shall disseminate data collected by other members, or information derived from such data, to non-members without the approval of the Steering Committee. Dissemination of information within a member's organization, including other divisions and the parent corporation, is permitted.

If individual members or external agencies contribute data not collected directly as part of a cooperative project, such data will not be released to third parties, including individual members of the Association, without the agreement of the owner. Such data would not be accessible through provincial freedom of information legislation unless directly funded through FRIAA. Analytical results, including crop performance reports and yield forecasts, will be shared among members. The data and results obtained will not be further distributed or published without the approval of the Steering Committee. This consent will not be unreasonably withheld. Reports and scientific manuscripts for projects funded through FRIAA will ultimately be accessible to the public.

3.7. Justifications for External Funding

Members may elect to sponsor their contributions to the FGYA from FRIP (Forest Resource Improvement Program). The FGYA's program fulfils the proposal evaluation criteria of FRIAA, and is not a regulatory responsibility of the industrial members. Funding or collaboration will also be sought from other sources, given the program's:

- Alignment with provincial forest management and research priorities;
- Alignment with federal and provincial priorities for science and technology transfer and sustainable forest management;
- Opportunities for research and demonstration provided by field trials.

Justifications and qualifications for funding through FRIAA and other sources are summarized as follows.

3.7.1. Application of Results

The FGYA's activities are enhancing the management of forest resources by providing a continually improved, scientific, quantitative, and credible basis for:

- Linking regeneration standards and practices to timber yield objectives;
- Evaluating and selecting silvicultural regimes and crop plans to enhance management of Lodgepole pine;
- Forecasting the sustainable supply of timber from forest tenures containing Lodgepole pine, and validating estimates of allowable cut;
- Improving the sustained yield of these forests through enhanced forest management;
- Providing decision-support tools for the management of stands attacked by mountain pine beetle.

Results apply directly to over two million hectares of tenured and operable pine stands with a current allowable cut of about 5 million cubic metres per year, within the forest tenures of the 9 member companies of the FGYA. Information gathered is being used to assess, develop, and approve strategies for enhanced and sustainable forest management within these forest tenures. It will be incorporated into regeneration standards, silvicultural prescriptions, crop plans, managed stand yield tables, and forest management plans. Because trials are stratified on an ecosystem basis, rather than just by tenure, the results will be generally applicable to the natural range of Lodgepole pine in Alberta.

The FGYA is enhancing the integrated and sustainable management of forest ecosystems through:

- Improved assessment of ecosystem productive capacity;
- Improved assessment capability of the sustainable use levels of a biological resource;
- Promotion of cooperation, partnership, and shared responsibility among forest managers and researchers;
- Increased levels of knowledge and awareness of sustainable forest management;
- Continual improvement of sustainable forest management practices including the impacts of alternative silviculture practices on growth and yield and allowable annual cuts;
- Stand-level data providing the basis for assessing impacts of enhanced forest management practices on biological diversity, natural ecosystem processes, fire spread, and contributions to global ecological cycles;
- Development of decision support tools to mitigate the impacts of mountain pine beetle on sustainable timber supplies;
- Bridging basic research to market-driven applications such as prototype forestry practices and decision-support tools, demonstration, and feasibility investigation.

3.7.2. Relationship to Existing Responsibilities

The work undertaken by the FGYA pertains to the voluntary enhancement of forest management information and practices, and is not the responsibility of the industrial sponsors under any legislation, regulation, tenure, policy or specific agreement. The program will assist the Government of Alberta in meeting its responsibilities for sustainable resource management, by providing improved assessment of forest growth and yield through the development of scientifically rigorous data and third-party evaluations.

3.7.3. Standards

Standards of experimentation will meet those accepted by the scientific community for biometric research. This is being achieved by third-party participation in project planning, and / or review of experimental designs by recognized experts at the Canadian Forest Service, University of Alberta, or other recognized centres of excellence. Measurement standards will follow or exceed those used by the Canadian Forest Service (CFS) and ASRD for assessing stand dynamics. Standards for forest site classification and evaluation are based on the latest published and government-approved field guides for west central and southwestern Alberta. High standards of analysis will be ensured by use of qualified personnel, extensive networking with growth and yield analysts and modelers, and peer review of results.

The FGYA's activities will not have any adverse impacts on any other forest resource values or users.

3.7.4. Fair Market Value

Work will be undertaken using a combination of contractors and employees of the Foothills Research Institute and sponsors. General benchmarks, used to ensure that fair market value is obtained for planned expenditures, will include:

- Technical and operations directors: Prevailing consulting or salary rates for senior registered professional foresters with formal post graduate qualifications in forest science and twenty or more years relevant experience.
- Field co-ordination and quality control: Prevailing contract rates for a registered professional forester or technologist with a minimum of five years experience in forest field measurements.
- Other contractors and field personnel: Prevailing contract or wage rates based on the respective categories of work. Work will normally be competitively bid. Where competitive bidding is not practical (e.g. because of specialized requirements for uniquely held skills), assignments may be sole sourced. Proposals for services to be sole sourced will be scrutinized by at least 2 FGYA member organizations, in addition to the Director, for fair value.

4. Projects and Deliverables

The activities of the FGYA during the term of this Plan will focus on 5 of the following 7 projects:

- 1. Development and management of the Association;
- 2. Lodgepole pine regeneration;
- 3. (Comparison of pre-harvest and post-harvest stand development; No further activity is planned for Project 3);
- 4. Cooperative management of historic research trials;
- 5. (Regional yield estimators; No further activity is planned for Project 5)
- 6. Enhanced management of Lodgepole pine;
- 7. Regeneration management in a MPB environment.

Justification, purpose, methods, deliverables, required levels of effort and cost for active projects are addressed below.

4.1. Development and Management of the Association

4.1.1. Justification and Purpose

The Memorandum of Agreement among members of the FGYA requires a Coordinating Agency to administer the Association and a Director (program manager) to plan, develop and manage the Association's program, as directed by the Steering Committee and with the assistance of the Technical Committee.

4.1.2. Methodology

Section 3.3 describes the methodology adopted for developing and managing the Association, including the assigned roles, responsibilities and tasks.

4.1.3. Deliverables

- Annually updated 5-year business plan and annual work plan, with budgets by year for each project;
- Project proposals, plans, designs, reports and publications;

- Information exchange meetings, field tours and technical sessions (minimum of 1 meeting per year), cooperative arrangements with collaborating agencies;
- Active publicly-accessible web site;
- Mid-year and annual progress reports;
- Financial statements (annually and / or as required);
- Documented recommendations of the technical committee;
- Steering committee meeting minutes.

4.1.4. Finance

The development and management of the Association, including direction, field coordination and research and development tasks will be funded centrally and supported through a membership fee approved each year by the Steering Committee. FRIP funding for membership fees was approved by FRIAA for the periods April 1, 2000 to March 31, 2005 (FRIAA Project FOOMOD-01-01) and April 1, 2005 to March 31, 2010 (Project FOOMOD-01-03), and extended to March 31, 2011.

Table 2 shows financial projections for 6 years from April 1, 2009. In the projection the annual membership fee as approved in previous plans has been extended for one year to 2014-15 at the same rate.

Table 2 does not include the following contributions by members and collaborating agencies:

- FRI administrative and financial services;
- Participation on technical, steering and project committees;
- Attendance of meetings;
- Review of minutes, reports, proposals, experimental designs and scientific papers;
- Identification of candidate sampling and experimental sites;
- Contribution of existing information and data;
- Measurement and reporting of installations in Project 2 Regenerated Lodgepole Pine;
- Provision and support of existing models;
- Protection of research installations;
- Analysis and interpretation of data.

4.2. Lodgepole Pine Regeneration

4.2.1. Justification and Purpose

The purpose of the Project is to forecast and monitor the growth and yield of Lodgepole pine, regenerated after harvesting, in relation to site, initial spacing of planted stock, natural ingress and mortality, competing vegetation (brush), and density regulation (pre-commercial thinning). These effects and factors were considered by all members of the Association to be the highest priority for project development, given their implications for silvicultural prescriptions, crop planning, regeneration standards, and allowable cut, and the lack of controlled data currently available for assessing alternative practices.

Since the Project's inception, the linking of early crop condition and treatment to subsequent growth and yield has assumed a high priority among FGYA members who are seeking to develop stratum-specific reforestation standards based on the yield objectives contained in their forest management plans. This requires linking crop performance (e.g. as measured in performance surveys 8-14 year performance surveys) to growth and yield predictions, and forecasting crop performance from site and treatment variables and from early crop attributes (e.g. as measured by 4-8 year establishment surveys). The project is entering a critical period over the next 5 years, during which the RLP trials will reach the 12-14 year performance survey window, and it will contribute substantially to meeting these requirements through the development of regeneration models. These decision support tools will allow managers to predict establishment and performance results based on site, stand, site preparation, planting, and vegetation management factors.

4.2.2. Methodology

The Project consists of a long-term field trial, established in 2001, and interim forecasting of effects using available models and data. The trial is a three-level split-plot design. The basic balanced design consisted of 90 field installations (5 ecosites x 6 spacings x 3 replications), with each installation split 2 ways into 4 treatment plots (weeding, thinning, weeding and thinning, no weeding or thinning). Twelve additional installations (6 spacings x 2 replications) were added in the modal ecosite category, to produce a total of 102 installations (408 plots). Details of the design, installations and procedures are provided in an *Establishment Report* (April 2003) and a periodically updated field manual. FRIP funding for the Project was approved by FRIAA for the period April 1, 2000 to March 31, 2005 (FRIAA Project FOOMOD-01-01). Continued funding to March 31, 2010 is provided for under FRIAA Project FOOMOD-01-03). A new proposal for a further five year extension of the program will be prepared in 2010.

4.2.3. Deliverables

Deliverables of the Project for the period April 1, 2007 to March 31, 2010 are shown in Table 3.

Note that installation status and measurements are the responsibilities of individual members, whereas other deliverables are the responsibility of the FGYA. Consistent with the Memorandum of Agreement, the project database was managed by the FtMF until 2007, when a member company assumed responsibility for database design, improvement and management on a temporary basis for 2007 and 2008. In 2009 a one-year contract was issued for database cleanup and management, and this contract is being renegotiated in 2010.

Annual status (mortality) checks and bi-annual full measurements will be continued for the first 12-14 growing seasons, subject to annual re-assessment of their importance. Table 4 shows a breakdown of

scheduled measurements for the 102 installations by year, number of growing seasons elapsed since planting, and forest management area (FMA). A more detailed schedule will be developed each year before commencement of fieldwork, and reviewed with technical representatives and contractors at a pre-season meeting.

No further fill-planting will be undertaken unless installations fail completely. Continued tending beyond the 10th year is not expected to be necessary. Pre-commercial thinning is tentatively planned for 2013, subject to assessments of mortality, ingress and growth in 2010 and 2012.

The crop performance reports include:

- Growth, ingress, competition and mortality statistics by treatment plot and growing season (or time since planting), with summaries by ecosite, treatment, FM area and growing season;
- Preliminary analyses to assess how much of the observed variation can be explained by controlled factors (ecosite, initial density, brushing);
- Preliminary exploratory analyses and strategy to develop regeneration models.

The regeneration establishment model predicts stocking, density, ingress, mortality and height and diameter growth over the first 7 years. It is applicable to forecasting results of establishment surveys. The regeneration performance model extends the prediction of these variables to beyond 8 years, and is linked to full-rotation growth and yield models. It is applicable to forecasting the outcome of performance surveys, and forecasting stand development through long-term growth trajectories. The variables and factors evaluated for making predictions will include: ecosite, planting density, vegetation control, various competition indices, time since planting, elevation and natural sub-region, pre-harvest site index, physiographic site, planting season, site preparation and cone count. The preliminary model based on the first 5 growing seasons and developed in 2007-08 was updated in 2009-10 to include measurements for the 7th growing season.

In 2008/09 the R&D Associate prepared a proposal for continuing RLP trial measurement and treatments through to the critical 12-14 year "performance survey" stage of development, which was reviewed with the FGYA Steering and Technical Committees at their March 20, 2009 meetings. See Table 4 and Appendix 2. Regenerated Lodgepole Pine Trial: Proposal and Priorities for Measurement and Treatment. March 2009. These recommendations were updated in the 2009 Crop Performance Report (March 1, 2010).

In view of combination of growing interest in the effects of climate change on regeneration survival and growth, and observed variation in crop performance likely to be linked to local climate, during 2007 a project was expored of linking growth and mortality during the first 5 years of the trial to regional and locally-interpolated climate records. Following a preliminary study of the RLP trial planted stock results (Interim Technical Note, February 2009) the work was expanded to include data from an earlier study of natural regeneration by lves and Rentz *Technical Note 2010-3*, February 2010.

Table 3. Delivery Schedule for Lodgepole Pine Regeneration Project

Deliverable	Progress / Next Steps	Reference			
Measurement and treatment schedule (Annually by June 15)					
Field measurements Status checks – annual Full measurements – bi-annual (data submission by October 31)	Completed as per experimental design to 2009. Most QC problems encountered in 2008 and 2009 have been addressed. Some replacement and moving of sample tree tags required to assist finding sample trees in plots with dense ingress . Continue full measurements bi-annually, and annual status checks if possible	Field Manual for Measurements and Maintenance v.3.0 July 2009 (minor amendments will be made prior to 2010 field season)			
Summary status and verification reports (January 31, prior to final payments to sponsors by FRIAA)	Distributed December 2009. Continue procedure in 2010	Audit and work verification reports, December 2009.			
Digital database (updated annually, December 31)	2009 update complete. Database cleaning and management done under contract 2009. Propose using same contractor in 2010	RLP Task Force Report July 10 2009			
Field treatments	No treatments, potential commercial thinning in 2013.	Information Note: Regenerated Lodgepole Pine Trial – Proposal and Priorities for Measurement and Treatment. March 2009			
Initial crop performance report (3-4 growing seasons)	Delivered December 2005 for performance up to March 31, 2005	Crop Performance Report, 2005.			
Crop performance report and regeneration establishment model (5 growing seasons) (March 31, 2008)	Distributed April, 2008.	RLP 5-year crop performance report, model and metadata (distributed April, 2008).			
Crop performance report (8 growing seasons), regeneration performance model (8-9 growing seasons) and Project (Phase 2) final report (March 31, 2010)	 Phase 2 (10 year) report March 31, 2010 including crop performance and regeneration model. Regeneration models for planted and naturally regenerated pine were produced in February 2010. Enhance to incorporate climate data inputs (June 2010), and 2010 field data (March 2011). 	Regenerated Lodgepole Pine Trial 2009 cropperformance report, March 1, 20101. Technical Note 2010-1RLPp: A Regeneration Model to Predict theEstablishment and Performance of Planted LodgepolePine February 2010.2. Technical Note 2010-2RLPn: A Model to Predict the Establishment andPerformance of Natural Regeneration Following			
		Performance of Natural Regeneration Following Harvest of Lodgepole Pine Stands. February 2010			

Deliverable	Progress / Next Steps	Reference				
Assess feasibility of linking mortality and growth to climate; prediction of climate impacts on mortality	Feasibility confirmed and mortality probabilities predicted.	Interim Technical Note: Effects of Climate on Mortality of Young Planted Lodgepole pine, Februa 2009.				
If linkage feasible, assess predictability of drought, frost, and winter desiccation impacts using CFS and local gridded climate data sets	First iteration using 5 year RLP results : December 31, 2008 2 nd iteration with 7 year RLP results: done Technical Note prepared Feb. 2010 Prepare peer reviewed scientific paper, risk maps and other decision-support products in 2010	<i>Technical Note 2010-3</i> Effects of Climate on Mortality of Immature Planted Lodgepole pine, February 2009.				
Compare mortality and ingress results with other studies; Assessment of Ives and Rentz data, FGYA pine- aspen results etc. (September 30, 2008)	Assessment of Ives and Rentz data completed. Regeneration predictions for height and ingress reconciled with earlier studies by Crossley and Johnstone	See Technical Notes 2010-2 and 3				
Extend regeneration model to 7 growing seasons (March 31, 2009)	Complete February 2010. Completion was delayed because of data quality issues that were addressed and corrected in 2009.	 Technical Note 2010-1 RLPp: A Regeneration Model to Predict the Establishment and Performance of Planted Lodgepole Pine February 2010. Technical Note 2010-2 RLPn: A Model to Predict the Establishment and Performance of Natural Regeneration Following Harvest of Lodgepole Pine Stands. February 2010 				
Development and testing of mathematical models by external institutions (June 30, 2008)	Solicitations of interest started, more enquiries in progress. Andreas Hamann (UofA) reviewed climate results, and is collaborating on a technical paper.					
Interpretation of results by knowledgeable practitioners	Two FGYA members provided feedback and field review of results and the 5-year regeneration model. Workshop and ongoing discussion group planned for 2010.					
Extension of model to other species and ecosystems	Informal proposals made; interest expressed but no progress. Implications of MPB project as well as climate change impact study may lend urgency to this need within lodgepole pine ecosystems of interest to FGYA					
Plan for continued trial measurement and treatment (February 28, 2009)	Done subject to FGYA member review and approval Will be incorporated into a new 5-year proposal	Information note: Regenerated Lodgepole Pine Trial: Proposal and Priorities for Measurement and Treatment: March 2009 Regenerated Lodgepole Pine Trial 2009 crop performance report, March 1, 2010

FM = full measurement, SC = status check

4.2.4. Finance

Costs of fieldwork are incurred directly by each member for those installations (clusters of experimental plots) located on their forest management area. Work is administered directly by the member, with the FGYA playing a coordination and quality control role. FRIP funding for continuation of the Project was approved by FRIAA for the period April 1, 2005 to March 31, 2010 (FRIAA Project FOOMOD-01-03). A new five year proposal for the next period April 1, 2010 to March 31, 2015 is under development.

Members wishing to use FRIP funds to cover their inputs will submit to FRIAA:

- A supplementary proposal summary application referencing the umbrella proposal;
- A proposed payment schedule;
- Annual financial and work verification reports.

Estimated measurement costs shown in Table 5 for Project 2 are approximate expectations based on the work schedule shown in Table 4, and should be regarded as only indicative orders-of-magnitude of the actual costs to be incurred by members. Assumed measurement costs per installation (cluster of 4 plots) are assumed at \$3000 and \$600 for full measurements and status checks respectively. Costs for continued tending are not specifically included, but may be covered by the assumed contingency allowance.

Table 5. Estimate of Remaining Costs⁷ to be Incurred by Members for the Lodgepole Pine **Regeneration Project in 2010**

Cost item	Estimated
Cost item	Cost
Status checks	13,200
Full measurements	210,000
Total measurements	223,200
Contingency	15,000
Total	238,200

4.3. Comparison of Pre-harvest and Post-harvest Stand Development

4.3.1. Justification and Purpose

The FGYA completed a comparison of pre-harvest and post-harvest site indices, and no further expenditures are planned at this time. In 2004 these results were presented at a major international forestry conference and published in the conference proceedings.⁸ The specific purpose of the comparison was to provide credible and reliable forecasts of post-harvest site index, for the main site types of interest to members, relative to pre-harvest values. The study demonstrated that regeneration practices following harvesting are capable of increasing site index and fibre production relative to those of fire-origin stands, most likely because of differences in initial stand densities relative to those of fireorigin stands. However, these shifts are not without associated risks and residual uncertainties. Priorities were identified for enhancing productivity, managing risks, and reducing uncertainties. Although the original objectives of the project have been met, the FGYA will undertake or encourage further work to:

- 1. Validate the initial results;
- 2. Confirm the role of stand density management in the observed differences;
- 3. Explore the implications to yield forecasting of post-harvest stands having different stocking-density relationships to fire-origin stands;
- 4. Integrate knowledge from the disciplines of genetics, silviculture and forest health into the prediction of yield following harvesting.

4.3.2. Methodology

- 1. Validation. ASRD will continue to collaborate with the FGYA in comparing site index changes observed in the FGYA study with trends observed in other datasets, and computed with later improved site index models.
- 2. Effect of stand density. Stand height development at different densities in CFS spacing trials will be compared with the observed shifts in site index between fire-origin and managed stands to assess whether the latter shifts can be explained in terms of managed densities.
- 3. Stocking-density relationships and spatial effects. Initial densities in post-harvest stands may not need to be as high as indicated by models based on fire-origin stands if regeneration is better distributed over the site as a result of reforestation treatments. The GYPSY program of ASRD is making excellent progress in modeling these effects. The FGYA will therefore not duplicate this effort, but will monitor closely and assist where possible.

⁷ Estimated cost per plot – full measures \$3,000; status checks \$600

⁸ Dempster, W.R. and Huang, Shongming. Enhanced Fibre Production and Management of Lodgepole Pine. CIF/SAF Joint 2004 annual general meeting and convention., October 2-6, Edmonton, Alberta, Canada Foothills Growth and Yield Association

4. Integration of interdisciplinary knowledge. The FGYA and FtMF, in conjunction with the Alberta Forest Genetic Resources Council (AFGRC) hosted a conference on post-harvest stand development in January 2006. The FGYA will continue to cooperate with the AFGRC and other participants in following through on recommendations developed by the conference.

4.3.3. Deliverables

- 1. A scientific paper covering item 1 above was begun under the direction of the ASRD Senior Biometrician, who invited the FGYA Research and Development Associate to participate as a coauthor. This work was delayed pending the development of new Site Index Models by ASRD.
- 2. Work covering item 2 above will be scheduled and reported under Project 4 (see 4.4. below)
- 3. Results from items 1, 2 and 3 will be incorporated into the models and yield forecasts developed under the *Lodgepole Pine Regeneration* and *Enhanced Management of Lodgepole Pine* projects.
- 4. Collaborative efforts through the 3 Dialogue initiatives arising from the 2006 Stand Density Management Conference have been suspended until the Chairs indicate a need to meet again.

4.3.4. Finance

No further costs are anticipated.

4.4. Cooperative Management of Historic Research Trials

4.4.1. Justification and Purpose

In August 2001, representatives of the FGYA, the CFS, and ASRD (Alberta Sustainable Resource Development) visited historic CFS Lodgepole pine trials. They concluded that these trials were invaluable resources for forecasting, monitoring and demonstrating the effects of nutrition and density management, and that links should be forged to ensure their ongoing protection, measurement and interpretation. In 2002 the Director General of the Northern Forestry Centre, the Executive Director of the ASRD Forest Management Branch, and the Chairman of the FGYA, signed a Letter of Agreement facilitating the collaborative arrangements necessary to provide forest managers in Alberta with the full and continued benefit of relevant long-term field trials established to assess the responses of Lodgepole pine to nutrition and density management.

The initial term of the Agreement was from July 1, 2002 – June 30, 2007, and a five-year renewal was proposed in 2007. By then, responsibility for these trials had passed from the CFS' Northern Forestry Centre to the Canadian Fibre Centre of the CFS and its representatives requested changes in the Agreement to reflect their interests in the trials. An interim renewal was signed to April 30, 2008 while a new five year renewal was negotiated. This is now complete and it runs through to March 31, 2013 to facilitate working arrangements for collaboration and continuing access to and use of historic trials for the purpose of improving knowledge of growth, yield, silviculture and fibre qualities.

In 2009, the CWFC approved a \$50,000 grant, extended over two years, to support and expand the work of the FGYA on historic research trials. This Agreement includes funding for measurements of the Clearwater plots as well as some that would not normally be scheduled based in current priority listings. These include: Gregg 84 (low & high sites), McCardell, Teepee Pole and Strachan Plots.

4.4.2. Methodology

The Project involves 3 main tasks:

- 1. Maintenance and protection of the field installations;
- 2. Analysis of historic data and synthesis of results;
- 3. Ongoing measurement.

This is a cooperative effort shared between the FGYA, CFS (Canadian Wood Fibre Centre) and ASRD. Details of proposed objectives, data sharing arrangements, activities, level of effort, and contributions are contained in the Letter of Agreement. The FGYA's main roles are re-measurement and maintenance of the trials on a prioritized schedule agreed by the 3 parties, as well as analysis and interpretation of the results. Methods, schedules and sponsorship for this component of the project are specified in the approved FRIAA proposal: *Measurement and Maintenance of Historic Research Trials* (April 2003, FRIAA Project # FOOMOD-01-02). The original agreement approved by FRIAA specified FRIP payments for the first year (2003), but provided for multi-year extensions upon receipt and approval of amended work plans, budgets, reporting and payment schedules. The funding of measurements is subject to annual review of priorities by all 3 parties (FGYA, ASRD and the CFS), approval each year by the FGYA Steering Committee, and acceptance by FRIAA.

Table 6 shows a measurement schedule for the 5-year period 2010 – 2014. The trials indicated for measurement from 2010 onwards have been scheduled based on a priority assessment of plots, and discussion surrounding the renewal of the Letter of Agreement (FGYA, CFS, SRD). Plots shown as "low" priority will not be scheduled for remeasurement except under extraordinary circumstances, e.g. change in risk status or extraordinary funding. Table 6a shows FGYA measurements on the plots during the period 2003-2009.

Trial	2010	2011	2012	2013	2014

4.4.3. Deliverables

Deliverables originally scheduled for the period April 1, 2002 – March 31, 2008 are listed in Table 7.

The 2006 measurements of the 1963 Gregg spacing trials were analyzed to compare effects of controlled density on stand development with differences previously reported between post-harvest and fire-origin stands. The intent was to obtain and report an improved understanding of the cause and implications of developmental differences between stands of harvest versus fire origin. A "Quicknote" in 2008 provided a report and insights into the significance of these differences to the membership. A paper will be prepared by the Research and Development Associate and the ASRD specialists in cooperation with the CFS if results merit publication.

A project originally begun by the CFS was completed by the FGYA in 2008/09. In 2007, Gregg River and MacKay trials were reviewed against to growth & yield models used in Alberta (MGM and GYPSY) in two reports submitted by contract analyst Andria Dawson. Further work is needed and planned to evaluate the Gregg River and MacKay data against TASS and the new version of GYPSY.

Deliverable	Progress/ Next Steps	Reference

¹³ Figure represents annual expenses plus ending balance in 2014.

Foothills Growth and Yield Association

Costs incurred by the FGYA in implementing the project will continue to be allocated among voting members as per Section 3.4 and Table 1 of this plan. The original agreement approved by FRIAA: *Measurement and Maintenance of Historic Research Trials* (April 2003, FRIAA Project # FOOMOD-01-02) specified FRIP payments for the first year (2003), but provided for multi-year extensions upon receipt and approval of amended work plans, budgets, reporting and payment schedules. The funding of measurements is subject to annual review of priorities by all 3 parties (FGYA, ASRD and the CFS), approval each year by the FGYA Steering Committee, and acceptance by FRIAA.

The priorities for remeasurement of historic research trials were reviewed by the F&D Associate in 2009, thus the proposed remeasurement of the McCardle Creek 1984 fertilization and thinning trial was deferred pending completion of that review.

The Association has signed a renewed Letter of Agreement between the Association, the Canadian Forest Service and Alberta Sustainable Resource Development for the period 2008-2013.

In 2009, the CFS through the Canadian Wood Fibre Centre awarded a 2-year, \$50,000 grant to FRI for extra measurement and analysis of the Historic Research Trials beyond that which would normally be done. The McCardle, TeePee Pole and 1984 Gregg Low/High sites were measured using those funds. The funds will also be used in 2010 for measures and calibration of historic research trials against wood quality models. At the request of the CFS, an additional \$40,000 is added to the 2010 grant to cover extra costs of analysis of historic trial data.

4.5. Regional Yield Estimators

4.5.1 Justification and Purpose

ASRD wished to produce generalized stock, stand volume, and yield tables for each natural region, differentiated by broad AVI (Alberta Vegetation Inventory) cover groupings, enabling the Department to report credibly on both the current state of provincial timber resources, and their rate of growth. The Executive Director of Forest Management Branch requested the FGYA's support.¹⁴ The FGYA was interested in an improved basis for crop planning, evaluation of regeneration standards, sensitivity analysis, timber supply analysis and monitoring.

4.5.2 Methodology

The approach taken was to develop prototype compatible yield and growth estimation techniques for Lodgepole pine cover types in a pilot study involving:

- 1. Assignment of ASRD analytical staff to the Project, with ASRD's Senior Biometrician, Shongming Huang, taking the lead role in conducting the analyses;
- 2. FGYA (Director and technical sub-committee) participation in project design, identification of suitable data sources, progress review, assessment of results and prototypes;
- 3. Provision of data through direct bilateral arrangements between FGYA member companies and LFD;
- 4. Analyses quantifying the relationships between mapped AVI (Alberta Vegetation Inventory) attributes, input variables for ASRD's *GYPSY* growth and yield projection system, and direct estimates of stand yield;
- 5. Development by ASRD of prototype applications for testing by FGYA members.

 ¹⁴ D. Sklar, Executive Director, Forest Management Branch, personal communication to H. Lougheed, January 23, 2002

4.5.3 Deliverables

The project was intended to provide, and has provided:

- Prototype stratum-based stock and stand table estimators for Lodgepole pine ecosystems, compatible with stratification, and with forward and retrospective projection capability.
- Associated estimates of the precision of forecasts and the variability within strata.
- A report describing the estimation system and including technical recommendations for application of the system.

An Interim Report on the Development of Yield Estimators for Pure Lodgepole Pine Stands in Alberta was prepared by Yuqing Yang and Shongming Huang of the Forest Management Branch, ASRD, and edited and amended with input from the FGYA Director. It was circulated to members and included suggestions for further analysis and testing. The document is posted on the FGYA website as a technical information report. No further work is envisioned under the auspices of the FGYA (SRD will solicit support directly from FMA holders in the event it undertakes further work and requires further inputs).

4.5.3 Finance

Cost incurred in the provision of sample plot data (FGYA members) and analyses of data (ASRD) are not included in the FGYA budget. No direct revenues or expenditures are currently scheduled for this project.

4.6. Enhanced Management of Lodgepole Pine

4.6.1. Justification and Purpose

The project "Enhanced Management of Lodgepole Pine" ((FRIAA # OF-02-16) commenced in 2004 and was scheduled to run until March 31, 2009. A joint project of the FGYA and University of Alberta, it is focused on filling information gaps in nutrition and density management of both fire-origin and post-harvest stands. It is complementary to the 5 projects already initiated by the FGYA to improve the assessment of Lodgepole pine growth and yield in managed stands, and other work being conducted in Alberta and B.C.

The project objectives are to:

- 1. Develop techniques and yield tables to predict the growth response of stands to density and nutrition management practices with potential for enhancing timber volume, economic value, and / or forest health.
- 2. Produce stand assessment guidelines and interpretative criteria for selecting nutrition and density management treatments.
- 3. Establish a network of sample plots for demonstrating and monitoring actual versus predicted growth responses.
- 4. Assess impacts of enhanced forest management practices on stand composition, structure, biodiversity, susceptibility to fire and insect damage, and wood quality.

The Project is divided into 2 sub-projects aimed at addressing the main information gaps limiting achievement of the objectives. The 2 sub-projects are: (1) Lodgepole pine nutrition and (2) pine-aspen density management. Separate experimental designs have been developed for each sub-project, and are described in detail elsewhere.¹⁵

¹⁵ Project OF-02-16 Annual Report (2004), Work Plan (2005-2008), and Detailed Project Design Foothills Growth and Yield Association

4.6.2. Methodology for Sub-project 1: Lodgepole Pine Nutrition

This study focuses on providing members the ability to determine:

- 1. Which stands on their forest management areas are most likely to respond best to fertilization;
- 2. What yield increases can be expected from the stands most likely to respond.

The sub-project involves sub-sampling and selective treatment of 30 stands reconnoitered in 2004, of which 15 are young (10 - 30 years of age) post-harvest, and 15 mid-late (30-80 years) fire-origin. Baseline assessments were completed in May 2005.

Fixed-area treatment plots were established in the fall and winter of 2005 in 15 stands across a selected range of stand conditions (16 stands were budgeted but one delayed). Treatments include thinning to 2500 stems per ha (in 8 post-harvest stands only) and fertilization (300 kg per ha N plus blend) plus controls (2006). Tree, stand and foliar variables were measured prior and after treatment, and will be measured at 3, 6, and 9 years following treatment. (Only measurements up to year 3 were included in the funding request.) In February 2006 the Steering Committee approved additional funding to extend the above experimental treatments to a total of 30 sites. The additional sites were established, and all fertilization treatments applied, by the end of May 2006. First-year post-fertilization foliar analyses were conducted in the winter of 2006-7.

4.6.3. Methodology for Sub-project 2: Pine-aspen Density Management

The study assesses, on pine sites subject to hardwood competition, what density management alternatives are expected to provide the best total and coniferous timber productivity.

The sub-project involved selection of 18 post-harvest pine-aspen stands between 10 and 40 years of age, partitioning the stands into areas of high, medium and low aspen density, and measuring 6 plots in each stand. Plots were tree-mapped and measured in detail. A sub-sample of 3 plots in each of 9 of the stands was destructively sampled to obtain retroactive data on height and diameter increment for both pine and aspen. The remaining plots are being maintained for re-measurement. The analysis involves assessment of competition indices and responses useful for developing or validating whole-stand, individual-tree, and/or distance-dependent growth models. The resulting models will be used to provide the required forecasts within the project term, while the maintained plots will allow for longer-term monitoring of actual versus forecast growth and yield.

4.6.4. Deliverables

Table 9 shows the schedule of activities by fiscal year (April 1 - March 31) from 2006 onwards. Activities are shown as "done" if completed, or as "x" if scheduled for 2010. This project is behind schedule awaiting two outstanding reports by U of A scientists.

Table 9. Activity Schedule for Enhanced Management of Lodgepole Pine Project

Activity	2006	2007	2008	2009	2010
Sub-project 1: Lodgepole pine nutrition					
Installation and pre-treatment measurement	done				
Thinning, fertilization and post-treatment measurements	done				
1-year post-fertilization foliage analysis	done				
3-year growth response measurements ¹⁶			Part Done		
3-year post-fertilization foliage analysis			Done		
Analysis (3-year results and projections)				not done	Х
Sub-project 2: pine-aspen density management					
Stand selection	done				
Field sampling		done			
Analysis		Part Done		Х	
Analysis, synthesis of results and reporting					
			Interim	Quicknote	Х
Scientific paper (pine-aspen results) U of A			report		
Information reports (2) (EMLP1 and 2 Est. Reports) FGYA		done			
Information report (EMLP1 3rd Year Foliar Response) U of A					Х

Final deliverables and results of the Project will be reported as follows, as summarized in Table 10:

- Detailed technical reports will be submitted to FRIAA and the FGYA membership at the end of the second and fifth years, including details of trial establishment (done), techniques applied, responses measured, responses forecast, predictive models developed, and conclusions regarding factors influencing responses.
- At least one scientific paper will be prepared for peer review and publication in a recognized scientific journal.
- At least 2 information reports, one including managed stand yield tables, and one including stand assessment guidelines and interpretative criteria for thinning and fertilization, will be prepared and published.

4.6.5. Finance

The project (FRIAA # OF-02-16) is supported with FRIP funding to a maximum of \$442,800, provided under FRIAA's *Open Funds* initiative. This amount was augmented by \$108,810 of supplementary funding in 2006, and a \$9,300 transfer from Project 1 contingency funds in 2008 to increase the total budget to \$560,910. Table 11 shows costs by year. Note that this schedule applies to the whole project term, which was initially from April 1, 2004 to June 30, 2009. Actual amounts expended are shown for 2004-2008 and projected expenditures are shown for 2009.

FGYA costs for analysis from 2007 onwards (primarily time inputs by the Research and Development Associate) are covered under Project 1. The Associate will work with scientists from the University of Alberta, whose costs will be absorbed by the University.

¹⁶ Fire-origin stands were not measured because of extraordinary costs in establishment and stem mapping. If needed, funding for these measurements will be sought through other proposals, though at this time, no measurements are proposed.

Foothills Growth and Yield Association

4.7. Regeneration Management in a Mountain Pine Beetle Environment

4.7.1. Justification and Purpose

The project *Regeneration Management in a Mountain Pine Beetle Environment (*FRIAA Open Funds Project # OF-07-P019) began in late 2007, and has been extended to a second phase through FRIAA's Fire Hazard Reduction and Forest Health Program (Project # FHRFHP-028). The objective of this project is to provide tools for assessing treatment options (e.g. salvage, partial-cutting, site preparation, re-planting, fertilization, density management) and their growth and yield implications, for pure and mixed-species Lodgepole pine stands attacked by mountain pine beetle. The technical and scientific components of the project are managed by FGYA's Research and Development Associate, while the management supervision and operational elements are managed and partially supported by the Mountain Pine Beetle Ecological Program of the Foothills Research Institute.

The development of the project is predicated on the expectations that:

- High levels of infestation and mortality in members' forest management areas are probable and imminent;
- Knowledge of regenerated stand dynamics and growth performance will be critical to mitigation / amelioration;
- Regeneration and stand development pathways and options will be more complex than those so far studied by the FGYA;
- Maintenance of forest values and a viable forest enterprise may be enhanced by appropriately selected, and in some cases intensified, silvicultural practices;
- Urgency and the required scope of data capture and analysis in threatened stands and research installations are increased;
- Members will urgently need expert system / decision-support tools incorporating disparate information and knowledge;
- The FGYA is positioned to significantly contribute.

4.7.2. Methodology

Stage 1:

- Assess experience, research and data from B.C. and the U.S.A, and from stands in southern Alberta regenerated after earlier MPB infestations;
- Identify and profile susceptible stand types most important to member's timber supplies.

Stage 2:

- Assemble and develop relevant data and growth and yield models (e.g. for mixed species, short rotation, variable density, nutrition options) for projecting post-attack development of the most important stand types;
- Consolidate these into an expert system / decision-support tools, linked to landscape, timber-supply, regeneration and cost factors, that can be used to forecast the results and effectiveness of treatment options.

If / when and where major attacks occur, the project may involve a third phase to:

- Assess susceptibility factors and post-attack stand conditions;
- Monitor actual versus forecast outcomes.

4.7.3. Deliverables

FGYA Funding supports technical input by the Research and Development Associate as well as management activities by the Director, under Project 1 of the Work Plan. Table 12 shows the Delivery Schedule and current status of the stages of the project. FRI funding includes the time of the MPBEP Program head in managing the business and logistical aspects of the project.

A workshop was held in June 2009, bringing together experts from across Canada and Alberta forest managers to discuss the development of Decision Support Tools for MPB. The workshop served to clarify and refine program refinements, and identified important and relevant reference information, as described in the document: *MPB-Silviculture Decision Tools Workshop Report*, Friday, June 26, 2009, Hinton, Alberta, (available from FRI and FGYA).

The need and timing for a second phase of the project was predicated on expansion of the beetle infestation in Alberta and, unfortunately, this appeared to be the case as described in 2009 status updates from SRD (e.g. *Beetle Bulletin*, August 16, 2009), and communications from FGYA member companies.

4.7.4. Finance

This project is supported by funding from the Foothills Research Institute's Mountain Pine Beetle Ecology Program, as well as FRIAA Open Funds (Project OF-07-PO19); (Project FHRFHP-028, November 2009). An annual contribution by the FGYA to the project represents the time of the Research and Development Associate providing scientific and technical direction to the project, as well as some time by the Director. These costs are already accounted for under Project 1 – Development and Management of the Association. Funding and deliverables are for the five – year term of phases 1 and 2 of the project.

Table 12. Delivery Schedule for Forest Management in a MPB Environment

Deliverable	Progress/ Next Steps	Reference
A report of the BC and US experience and research (based in part on tour of areas subjected to attack in BC)	Done.	Dempster, W.R. 2007. Tour of Mountain Pine Beetle Affected Areas in the Prince George Forest District, July 11 and 12, 2007: Draft Report and Recommendations. 20pp + Appendix.
A research proposal describing detailed project design	Done	Udell, R.W. and W.R. Dempster. 2007. Monitoring and Decision Support for Forest Management in a Mountain Pine Beetle Environment: Proposal. October 9, 2007. FRIAA-07-08 Provincial Projects Initiative. 24pp.
Assessment of PSP supplementary data requirements	Done	MacDonald, E., Development of sampling protocol to quantify / document vegetation responses to MPB attack, June 25, 2008.
Pre-compilation of existing data and selection of candidate plots	Candidate list developed for 240 PSPs; 150 selected for baseline measurement in 2008.	Access database and Excel spreadsheets (including selection variables and criteria)
Baseline supplementary field measurements	149 plots were measured; MPB infestation status recorded: if correct (9 plots infected), this is too low for monitoring to proceed as planned (50 plots).	Pre-existing tree and new supplementary data input files (Excel) March 2009 Information note: Regeneration Management In a MPB Environment Priorities for Work in 2009.
Compilation of existing and new data – PSP database development	Data entered, verified, compiled and documented by contractor;	Access database plus documentation: Data compilation report – 2008 surveys; Access database 2008 tables description; SAS programs description.
Dendrochronological measurements and analysis	Measurements and analysis conducted and reported for 20 plots (15 stands); no representation in southern portion No further work currently scheduled	Preliminary report: Alfero <i>et al</i> , Dendroecology and stand dymamics of a selection of PSPs in Alberta.
Revised work plan and funding proposal (Sept 29, 2009 FRIAA Proposal)	Expansion of MPB infestation supported by Fire Hazard Reduction and Forest Health initiative. FGYA secured additional funds for a proposed Phase 2 of the project – to monitor the dynamics of MPB-attacked stands for improved management decision-making.	 Updated work plan and phase 2 proposal for the period September 1, 2009 – March 31, 2012 September 3, 2009 Monitoring and decision support for forest management in a MPB environment - Phase

Deliverable	Progress/ Next Steps	Reference		
		2 proposal September 29, 2009		
MPB population monitoring and status	 - 89 PSPs scheduled for basic monitoring in 2009/10 – work 90% complete, and status of completed plots compiled and reported - Monitoring schedules prepared for 2010 and 2011 	FGYA Technical Note 2010-4, March 5, 2010		
Decision support tool	Design work shop held June 26, 2009 Detailed terms of reference and specifications for a preliminary DST completed October 2009 Prototype to be demonstrated March 26, 2010 Preliminary DST scheduled for release June 30, 2010	- Foothills Research Institute - Foothills Growth and Yield Association MPB- Silviculture Decision Tools Workshop, Friday, June 26, 2009 Hinton Training Centre, Hinton, Alberta, Workshop Report.		

5. Annual Work Plan (April 1, 2010 – March 31, 2011)

This work plan follows the general format specified for all FRI annual work plans by the FRI Board and Executive, but is cross-referenced to the main Business Plan to reduce duplication.

5.1. Objectives and Deliverables

The mission and mandate of the FGYA are described in Business Plan Section 2.

Objectives and deliverables for each FGYA project, all of which have multi-year terms, are detailed in Business Plan Section 4. The following is a list and description by project of deliverables for 2010-11.

5.1.1. Project 1 - Development and Management of the Association

- Annually updated 5-year business plan and annual work plan, with budgets by year for each project (April 1 2010 for approved 2010 plan; February 2010 for draft 2011 plan);
- Project proposals, plans, designs, reports and publications (see under individual technical projects);
- Meetings, field tours and technical sessions:
- Pre-season meeting of technical representatives and contractors (June 15);
- Steering Committee and annual meeting (March 25 2010)
- Active publicly-accessible web site (throughout year);
- Mid-year (October) and annual (year-end) progress and financial reports;
- Steering committee meeting minutes (March 31, 2010 latest).

(See also Business Plan Section 4.1.)

5.1.2. Project 2 - Lodgepole Pine Regeneration

Activities planned for 2010-11 include:

- Detailed fieldwork schedule (June 15 latest);
- Scheduled status checks (28 installations) and full measurements (74 installations) October 1, 2010;
- Updated digital database December 31, 2010;
- Audit and work verification reports January 31, 2010;
- Crop performance report (9 growing seasons) March 15, 2011
- Project (Phase 2) final report and Phase 3 proposal April 30, 2010;
- Linkage of regeneration growth and mortality to climatic factors (March 31, 2011): publish work completed in 2009 (with academic co-authorship); if possible extend study to non-pine species and examine mortality trends against true time-series data; develop interpretations for silvicultural risk management decision support;
- Regeneration model development (March 15, 2011): incorporate 2010 measurements; if possible extend to non-pine species; develop an enhanced simulator (subject to technical committee review of alpha version and availability of funding for computer programming).

(See also Business Plan Section 4.2.)

5.1.3. Project 3 - Comparison of Pre-harvest and Post-harvest Stand Development

Follow-up work to results previously reported for this project will be conducted and reported under Project 4 (see Section 5.4 below). A *Dialogues* initiative led by FRI Communications and Extension Program as an outcome of the *Post-harvest Stand Development Conference* held in 2006 has been concluded. Some activities arising from this initiative are ongoing. Work undertaken in 2008 under Project 4 to compare historical trial data with growth and yield model projections, and analyses of the Gregg spacing trial, will be consolidated to produce an information report or scientific paper on implied yield differences between fire-origin and managed stands.

5.1.4. Project 4 - Cooperative Management of Historic Research Trials

A five-year Agreement between the FGYA, Alberta Sustainable Resource Development and the Canadian Fibre Centre of the CFS for the remeasurement and maintenance of these trials has been renewed and extends to March 31, 2013.

A two-year funding grant application (October 2009) was approved and \$50,000 awarded to the FGYA by the Canadian Wood Fibre Centre for extraordinary work on historic trials. At the request of the CFS, an additional \$40,000 is added to the 2010 grant to cover extra costs of analysis of historic trial data.

A system for evaluating priority remeasurement is in place, and all trials are rated accordingly. Fieldwork will continue on trials rated as "medium" priority, and some "low" priority trials may be remeasured if at risk from Mountain Pine Beetle mortality.

Fieldwork will continue only if re-measurement of the trials is determined to be useful for the development of analytical products (see Business Plan Section 4.4). However, some trials that would not normally be measured given the priority ranking system will now be measured by the request of the CFS using funds from the grant noted above.

Following evaluation of the utility of further CFS trial measurements, the installations were categorized for remeasurement. In 2010, three trials would normally be measured, of these only one is a priority:

- Clearwater Fertilization and Thinning 1968 to be measured
- Ricinus fertilization after thinning 1975 not scheduled, no priority
- Strachan Thinning not scheduled, low priority

Further testing of trial data against GYPSY and TASS will be conducted. This includes analyses of the yield differences between fire-origin and managed stands implied by measurements of the Gregg spacing trial. Originally scheduled for September, 2009, work will begin on this in June 2010. Results will be consolidated to produce an information report or scientific paper on implied yield differences between fire-origin and managed stands.

A preliminary assessment will be made of possible utilization of trials for relating stand health and mortality to climate change.

5.1.5. Project 5 - Regional Yield Estimators No deliverables are currently scheduled for 2010.

5.1.6. Project 6 - Enhanced Management of Lodgepole Pine

Analytical work on the 3rd-year foliage analysis is complete. Remaining analyses and projections for the 2 trials established under this Project are be done in cooperation with the University of Alberta as required for completion of the final Project Report by June 30, 2010. This work was to have been done by U of A

in 2009 and will be concluded in 2010, either by UofA as specified in the Agreement (Sub-project 1- Dr. Vic Leiffers; Sub-project 2 – Dr. Phil Comeau), or through other means. The value of 6^{th} year measurements will be also be reviewed in 2010.

5.1.7. Project 7 – Regeneration Management in a Mountain Pine Beetle Environment

The intent of this project is to provide decision support tools that will assist FGYA members and others mitigate timber supply impacts of the mountain pine beetle in Alberta by using knowledge of growth and yield in the silvicultural treatment of threatened or attacked stands.

Funding for this project was acquired through FRIAA Open Funds (proposal submitted October 2007) and FRI's Mountain Pine Beetle Ecology Program. Work began in 2008. FRI's Mountain Pine Beetle Ecology Program is responsible for funds and project management, while the FGYA's Research and Development Associate is responsible for technical and analytical elements of the project. Activities and deliverables in 2010-11 are:

- Field work is scheduled to expand in 2010/11 using additional funding from a \$274,995 grant from the FRIAA Fire Hazard Reduction and Forest Health Program.
- Existing and supplementary data for these plots will be compiled and combined with data collected in 2009 to 2011 to produce a consolidated baseline database and baseline assessment report;
- Projections and a prototype decision-support tool will be made utilizing the combined baseline data and the latest available models (Final Version June 2011);
- Further enhancements to the DST will be made through 2011 with the help of additional funding granted by the MPBEP of the Foothills Research Institute (MPBEP May 14 Activity Team Meeting)

FGYA Funding (Project 1) supports technical input by the Research and Development Associate as well as management activities by the Director. (See Business Plan Section 4.7.)

5.2. Extension and Communication

The FGYA Business Plan addresses the following aspects of extension and communication:

- Information exchange meetings, field tours and technical sessions;
- Maintenance of an active publicly-accessible web site;
- Technical reports, publications and bulletins;
- Collaboration with external institutions;
- Dissemination of information and sharing of data.

A Communications and Extension Strategy was prepared in August 2007, and updated in 2010 that includes the following activities for 2010-11 (some reports prior to March 31 2010):

- Crop performance report Regenerated Lodgepole Pine, 9 Growing Seasons
- Report on linkage between regeneration growth and mortality to climatic factors
- Regeneration model development and potentially a user-friendly simulator
- Information report or scientific paper on implied yield differences between fire-origin and managed stands
- Information report(s) on pine/aspen trials; fertilization and thinning trials
- Summary report of PSP monitoring for MPB impacts
- Preliminary DSS for silviculture decision making re MPB impacts
- Technical forum on MPB work summaries of presentations in Technical Session to highlight Mountain Pine Beetle projects by FGYA and others;
- Website updates;

Foothills Growth and Yield Association

• Two Quicknotes providing non-technical summaries of project results and / or program activities

In 2010, the FGYA will expand its efforts to serve its members and the forestry community in communications surrounding risk management in silvicultural decision making. Subject to the necessary approvals and cooperation, this initiative will involve:

- Hosting of a web-based, password-protected Silvicultural Risk Management Discussion Group (SRMDG);
- Release of regeneration models and related risk management tools and documentation;
- Workshop dedicated to training in use of regeneration models and other RLP project results, and discussion of implications for management (June 2010);
- Publication and presentation of climate effects study and related research;
- Polling of FGYA members to "baseline" risk management strategies;
- Literature reviews and solicitations to assemble relevant research and practice results for posting to the SRMDG;
- Identification of strategies for reducing silvicultural investment risks;
- Development of improved level of consensus on risks and associated research priorities.

5.3. Inter-program Links

The following activities or projects will be undertaken in collaboration with other FRI and external programs:

- **Database management**: The FRI Data, Information and Knowledge Management Program is currently responsible for safe storage of the Association's data.
- Website management: The FGYA, as a FRI program, has a dedicated section of the FRI website, and relies on the FRI Communications and Extension Program for management of the website.
- **Climate change**: The FGYA maintains an interest in the FRI Climate Change sub-program and, subject to funding, will work linking analysis of climate impacts on Lodgepole pine regeneration to climate change. Work has begun with U of A on examining the RLP data to determine relationships between growth, yield and mortality and climate change.
- **Historic research trials**: This project will continue to be conducted cooperatively through an inter-agency agreement with the Canadian Forest Service and Alberta Sustainable Resource Development.
- Enhanced management of Lodgepole pine: The University of Alberta has participated in the design, and will participate on the analysis, of this project under a research collaboration agreement with the FGYA. Currently, U of A has accepted responsibility for two information reports under the Agreement.
- **Regeneration Management in a Mountain Pine Beetle Environment:** This is a joint project with FRI, whereby FRI oversees the budgetary, contractual and field elements of the program and the FGYA's Research and Development Associate oversees research design and reporting as well as the technical and analytical elements of the program.

(See also Business Plan Section 3.5.)

5.4. Funding Sources

The following organizations are sponsoring members of the FGYA:

- Alberta Newsprint Company
- Blue Ridge Lumber
- Canadian Forest Products
- Millar Western Forest Products
- Spray Lake Sawmills
- Sundance Forest Products
- Sundre Forest Products
- Hinton Wood Products
- Weyerhaeuser Canada

All are companies or corporate divisions holding Forest Management Area tenures in the Foothills Natural Sub-regions of Alberta.

Each member contributes:

- An annual member fee of \$18,000 (\$21,000 authorized in original agreement) either directly or through FRIP Authorizations;
- In kind services, including measurement, treatment and maintenance of the *Regenerated Lodgepole Pine (RLP) Trial* (Project 2);
- Funding to other projects, pro-rated by pine-leading managed area according to a formula specified in the Business Plan Section 3.4.

Project 1, Development of the Association, is supported by the membership fees of the nine member companies and includes the management and field coordination of the FGYA programs as well as the research development, design and technical services of the Research and Development Associate.

Project 2, Regenerated Lodgepole Pine, is supported by in-kind services of the membership (plot measurement) as well as the annual membership fees paid.

Project 4, Historic Research Trials, is supported by annual membership contributions pro-rated based on the proportional representation of Lodgepole pine stands within individual FMAs compared to the total Lodgepole pine stand area in the cumulative member FMAs. It is also supported by a 2-year, \$90,000 grant from the Canadian Wood Fibre Centre of the Canadian Forest Service.

Project 6, Enhanced Management of Lodgepole Pine, is supported with FRIAA Open Funds.

Project 7, Regeneration Management in a Mountain Pine Beetle Environment, is supported with FRIAA Open Funds, with funding from FRI's MPBEP and with in-kind support from SRD and the FGYA.

Table 13 summarizes funding sources for 2010. Appendix 1 contains details and allocations of cash contributions from sponsoring members.

Project (Accounting Code)	Contributing Organization	Carry Forward	Cash Committed	Total Funding	In-kind Support	Comments
Project 1 FGYA (235)	Members	29,878	278,552	308,430		Member fees
Project 2 - RLP	Members				238,200	Fieldwork
Project 4 - HRT (235.1)	Members	14,430	60,000 ¹⁹	74,430		Historic research trials
Project 6 - EMLP (235.2)	FRIAA Open Funds OF-02- 16	(5,410)	5,010 ²⁰	(400)		Enhanced management of Lodgepole pine
Project 7 – MPB	FRI and FRIAA Open Funds					Reported under FRI's MPBEP
Total FGYA		38,898	343,562	382,460	238,200	

Table 13. Scheduled income for 2010-11

Details on the annual and projected income and expenditures for each of these projects may be found as follows:

Project 1 – Management of the Association -	Table 2
Project 2 – Regenerated Lodgepole Pine -	Table 5
Project 3 – Comparison of Pre- and Postharvest Stand Development -	No direct costs
Project 4 – Historic Research Trials -	Table 8
Project 5 – Regional Yield Estimators -	No Activity
Project 6 - Enhanced Management of Lodgepole Pine -	Table 11

FGYA technical and analytical input by the Research and Development Associate to the various projects is covered under Project 1.

5.5. Program Key Members and Responsibilities

Roles and responsibilities for the FGYA program are described in Business Plan Section 3.3. Note that effective 2007 responsibilities for project management, field coordination, and analytical research and development have been re-allocated (see Sections 3.3.4 and 3.3.5). Management staff and corporate representatives are identified with their contact information in Table 14.

5.6. Environmental and Occupational Health and Safety Permits

With the exception of supervision, administration and data management tasks conducted directly by FRI staff, the FGYA program and projects are implemented by contractors. Contracts are administered by the FRI and stipulate statutory compliance of the contractor with the laws of Alberta, explicitly including the Occupational Health and Safety Act.

Field trials and associated silvicultural activities are conducted and permitted under authority of the sponsors' timber tenures.

¹⁹ Member contributions CWFC \$60,000

²⁰ Final FRIAA payment pending submission/acceptance of final reports

Appendix 2 **Foothills Growth and Yield Association** Information Note **Regenerated Lodgepole Pine Trial Proposal and Priorities for Measurement and Treatment** March 2009

Background

The long-term trial was designed to forecast and monitor the growth and yield of harvest-origin Lodgepole pine in relation to site, initial spacing of planted stock, natural regeneration, mortality, vegetation control (weeding), density regulation (pre-commercial thinning). In the shorter-term, including during the current term of FRIAA Project FOOMOD-01-03 ending in 2010, the main value of the project and focus of data collection and analysis are to provide an improved basis for forecasting achievement of establishment and performance targets associated with regeneration standards being developed or adopted by the FGYA members.

The trial was established between the summer of 2000 and the spring of 2002, and results for the first 5 growing seasons were reported in detail in April, 2008.²³ Table 1 shows the age of the installations as of the end of 2008. (Each group within each eco-class consists of 5 installations planted at different densities, and one non-planted installation.)

Eco-class	Group	Block age (years)	Growing seasons since planting
1	1	9	7-8
	2	9	7
	3	9	8
2	1	9	8
	2	8	7
	3	8	7
3	1	9	7
	2	8	8
	3	8	7
	4	8	7-8
	5	8	7
4	1	8	8
	2	8	7
	3	8	7
5	1	8	7
	2	7	7
	3	7-9	7-8

Table 15. Current installation ages (from harvest and planting)

²³ Regenerated Lodgepole pine trial, analysis of crop performance 5 growing seasons after planting, 4 April 2008. FGYA Technical Report. Foothills Growth and Yield Association

Priority 1. Checks, Corrections and Maintenance

The 4 highest priorities for 2009 are listed below.

- Insufficiently sampled natural regeneration. Ensure sampling of natural regeneration in nonplanted installations conforms to the project design as specified in the field manual. As documented in the 2008 Error Report, there are 16 treatment plots with less than 50 sample trees (the number specified in the manual), but in which counts indicated more than 50 trees present. In at least some of these plots, failure to follow the tagging procedure is suspected. They should all be checked in 2009, and more trees tagged and tallied where applicable.
- *Missing trees.* Installations where the % of missing trees is very high (approaching or exceeding 4%) should be checked to ascertain whether the trees can be assumed dead.
- Selective mortality assessments. Analysis of mortality data highlighted trends with climate that have important implications and have not previously been reported elsewhere. Visits by experts in silviculture and forest health to a small number of selected plots on different site types (*Ledum* and non-*Ledum*) showing high or anomalous mortality rates may shed important light on the observed results.
- *Plot maintenance.* Ensure installation demarcation and tree tags are in good order.

Priority 2. Continued Measurements

Continuation of essentially the same data collection protocol as applied over the last 2 years is desirable for a further 5-7 years. Table 2 shows the schedule for the next 5 years.

FMA	# of installations	2009	2010	2011	2012	2013
ANC Timber	6	8 (SC)	9(FM)	10(SC)	11(FM)	12(SC)
Blue Ridge Lumber	6	8 (SC)	9 (FM)	10(SC)	11(FM)	12(SC)
Canfor	6	8 (SC)	9 (FM)	10(SC)	11(FM)	12(SC)
Hinton Wood Products	12	9 (FM)	10 (SC)	11(FM)	12(SC)	13(FM)
	10	8 (SC)	9 (FM)	10(SC)	11(FM)	12(SC)
Millar Western	6	8 (SC)	9 (FM)	10(SC)	11(FM)	12(SC)
Spray Lakes	6	8 (SC)	9 (FM)	10(SC)	11(FM)	12(SC)
Sundance	6	8 (SC)	9 (FM)	10(SC)	11(FM)	12(SC)
Sundre	14	9 (FM)	10 (SC)	11(FM)	12(SC)	13(FM)
Weyerhaeuser D.V.	6	8 (SC)	9 (FM)	10(SC)	11(FM)	12(SC)
Weyerhaeuser Edson	6	8 (SC)	9 (FM)	10(SC)	11(FM)	12(SC)
Weyerhaeuser G.P.	2	9 (FM)	10 (SC)	11(FM)	12(SC)	13(FM)
	16	8 (SC)	9 (FM)	10(SC)	11(FM)	12(SC)
Total Full Measurements		28	74	28	74	28
Total Status Checks		74	28	74	28	74
Total	102	102	102	102	102	102

Table 16. Elapsed Growing Seasons and Scheduled Measurement Type by Year and FMA

FM = full measurement, SC = status (mortality) check

The scheduled work would provide data for modeling the entire regeneration phase, as well as a link to growth-phase models like GYPSY. Annual measurements are desirable. (The main value of checking the plots every year would be better and earlier mortality prediction and climate linkage.) Failure to measure the plots at least every 2 years would result in a substantial loss in predictive information, devaluation of the investment already made in the trial, and delay in development of prediction tools.

After the next 5-7 years, i.e. once the trial has passed through the dynamic regeneration phase, the installations can be monitored on a less intensive basis during the growth phase of the rotation.

Priority 3. Treatments

No further fill-planting or weeding treatments are required. The project design calls for pre-commercial thinning of the designated treatment plots where natural regeneration has resulted in the target density being exceeded. While it is desirable to thin before significant crown-competition occurs, this operation should not be undertaken until ingress of natural regeneration is complete or at least declining, and irregular mortality has stabilized. Neither of these conditions has yet occurred. The trial appears to be generally conforming to ingress trends earlier reported by Crossley,²⁴ which would suggest that ingress may continue up to 14 years after peaking at about 7 years. On many installations mortality of planted stock shows no sign of declining, and trends of mortality in natural regeneration have not yet been confirmed. It is proposed to delay thinning until 2013, subject to assessments of mortality, ingress and growth in 2010 and 2012.
