The primary deliverable of this project is the development of a RAD Plan. The plan will:

- validate the original primary access corridors identified in the 2008 approved IIAP,
- rationalize the need for secondary roads in the future (those coming off of primary corridors),
- identify whether the planned roads are required as permanent or temporary access,
- align pipeline routing.

The plan will not consider seasonal roads, those in use for less than 2 years, or in-block roads and access to well-heads.

As part of the planning process, the project will identify, evaluate and make recommendations on:

- integrated access management and mitigation strategies (e.g., gates, restoration) that can be used across a variety of planning processes and time horizons (i.e., DFMP, AOA, individual dispositions, etc.),
- risk assessment models,
- parameters required for computer modelling, simulation and scenario testing,
- data needed to support this planning, along with data security, compilation, maintenance, and storage needs,
- information and communication strategies for government, industry and other audiences,
- opportunities to improve/enhance the current SRD approval system for such plans,
- misalignments, operational conflicts (such as FMA vs IL 2003-23 road standards), and barriers to planning (e.g., other departments),
- monitoring and evaluation processes to assess plan implementation against targets for all new (as built) footprint.

For all of the above, the opportunities and challenges of the approaches selected will be documented to capture key learnings for future RAD planning efforts.

The following will further direct this work:

- Resource development will continue to occur in the area.
- The Berland-Smoky Integrated Industrial Access Plan will guide industrial access to the area approved through IL2008-05.
- Resource tenure is not within the project scope.
- Most current data available will be used. Data collection is not within the scope of this project and completion of the work will not be delayed from expectations for imminent new information. However, new information will be addressed as it becomes available and plan reviews occur.
- The RAD Plan may require amendment to conform to the Upper Peace and Upper Athabasca Regional Plans.
- The RAD Plan, once approved, does not grant access to the area; current review and approval processes will be used.
- Integrated land management principles will be applied.
- The full scope of adaptive management (i.e., plan-do-check-adjust) is expected.
